Introduction to Microarchitectural Attacks

Daniel Gruss

June 18, 2019

Graz University of Technology

Software-based Side-Channel Attacks

- security and privacy rely on secrets (unknown to attackers)
- secrets can leak through side channels

Software-based Side-Channel Attacks

- security and privacy rely on secrets (unknown to attackers)
- secrets can leak through side channels
- software-based $\rightarrow$ no physical access

FOOD CACHE

Revolutionary concept!

Store your food at home, never go to the grocery store during cooking.

Can store **ALL** kinds of food.

ONLY TODAY INSTEAD OF ~~$1,300~~

$1,299

FAIL
failblog.org

- Very short timings
- `rdtsc` instruction: “cycle-accurate” timestamps

```
[...]
rdtsc
function()
rdtsc
[...]
```

What are we measuring?

- Do you measure what you *think* you measure?
- *Out-of-order* execution → what is really executed?

```
rdtsc
function()
[...]
rdtsc
```

```
rdtsc
[...]
rdtsc
function()
```

```
rdtsc
rdtsc
function()
[...]
```

Accurate Microarchitecture Timing

- use pseudo-serializing instruction `rdtscp` (recent CPUs)

- use pseudo-serializing instruction `rdtscp` (recent CPUs)
- and/or use serializing instructions like `cpuid`

- use pseudo-serializing instruction `rdtscp` (recent CPUs)
- and/or use serializing instructions like `cpuid`
- and/or use fences like `mfence`

- use pseudo-serializing instruction `rdtscp` (recent CPUs)
- and/or use serializing instructions like `cpuid`
- and/or use fences like `mfence`

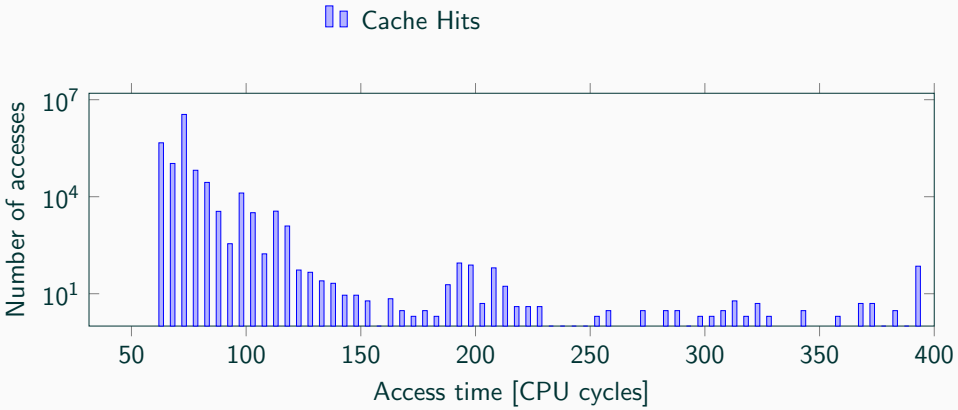
Intel, *How to Benchmark Code Execution Times on Intel IA-32 and IA-64 Instruction Set Architectures White Paper*, December 2010.

AUGUST 22, 2018 BY BRUCE

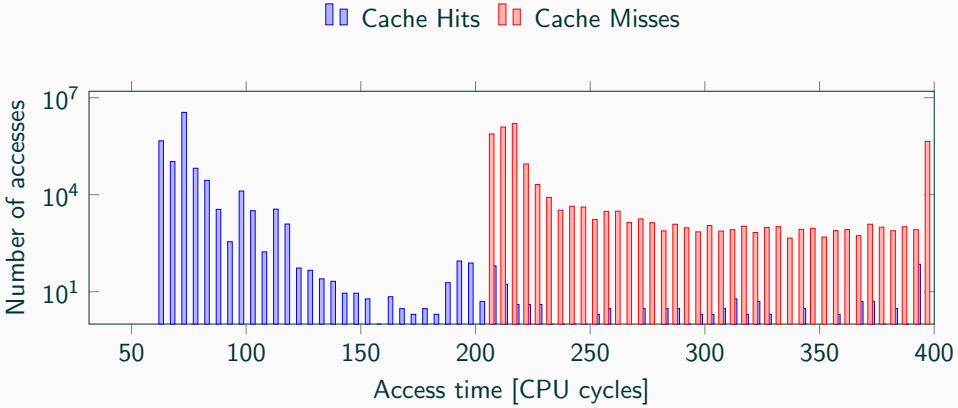
Intel Publishes Microcode Security Patches, No Benchmarking Or Comparison Allowed!

UPDATE: **Intel has resolved their microcode licensing issue which I complained about in this blog post.** The new license text is here.

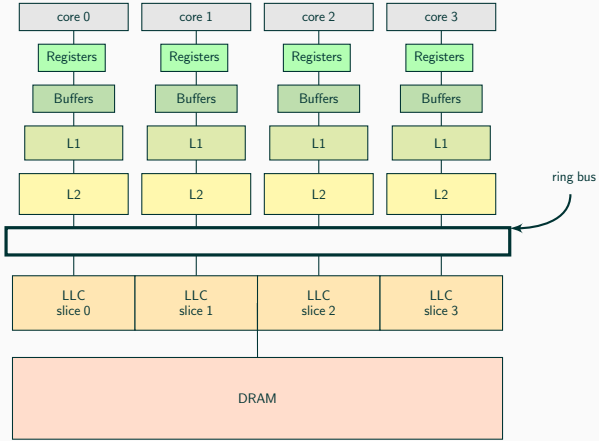
Memory Access Latency



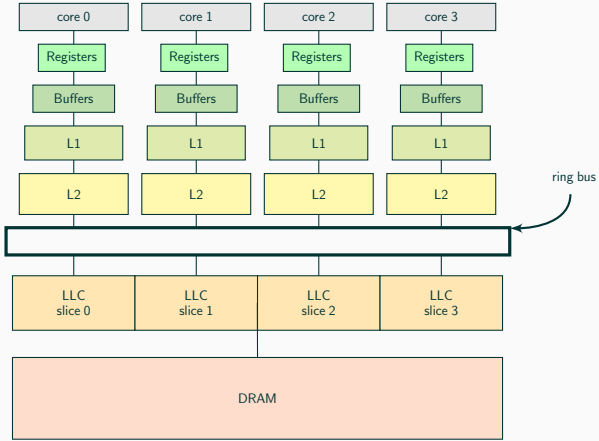
Memory Access Latency



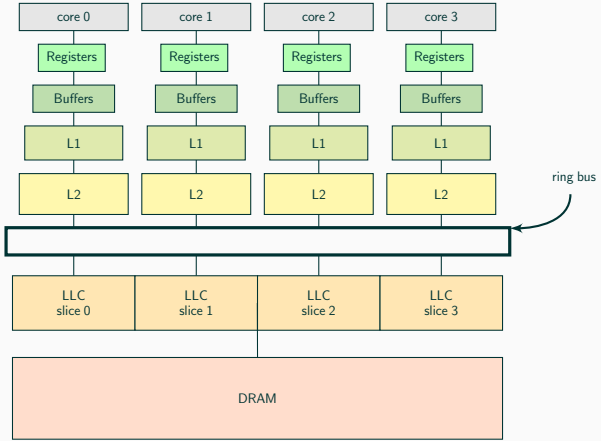
Memory Hierarchy



Memory Hierarchy

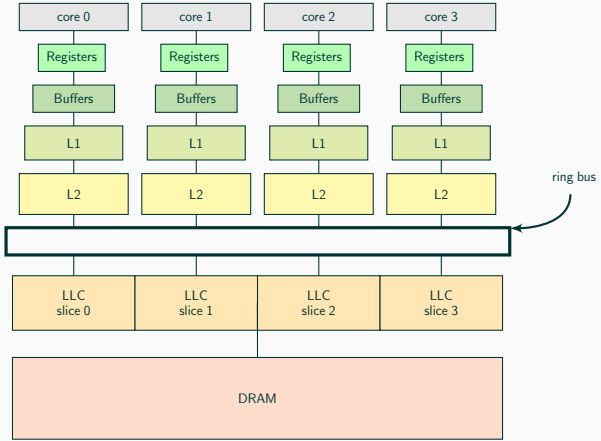


Memory Hierarchy



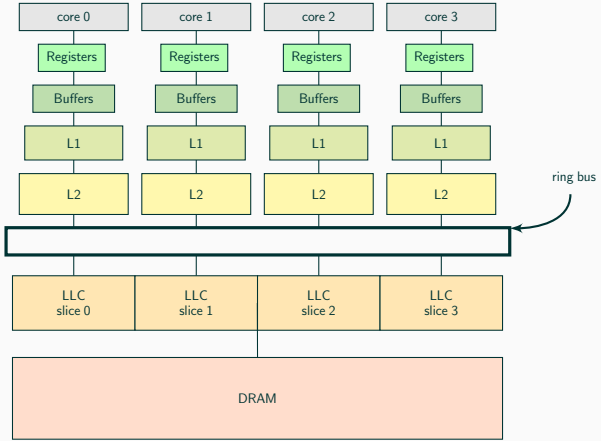
- L1 and L2 are private

Memory Hierarchy



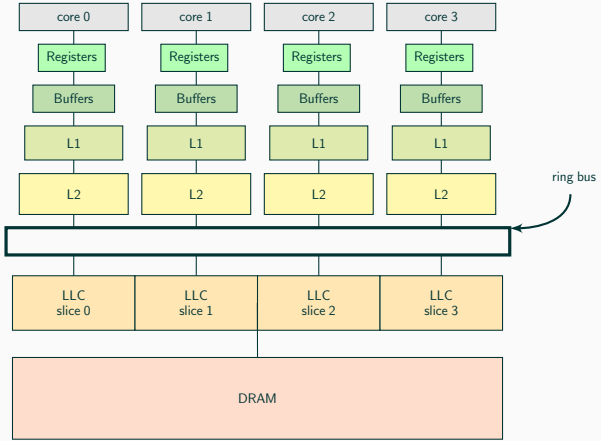
- L1 and L2 are private
- last-level cache:

Memory Hierarchy



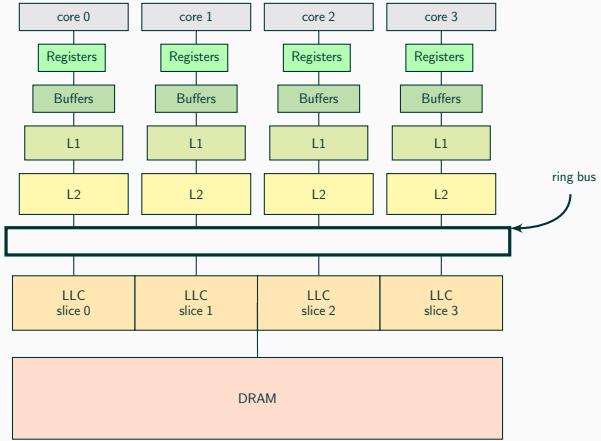
- L1 and L2 are private
- last-level cache:
  - divided in **slices**

Memory Hierarchy



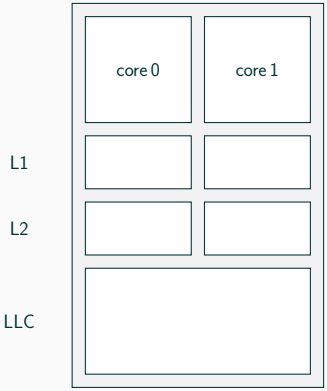
- L1 and L2 are private
- last-level cache:
  - divided in **slices**
  - **shared** across cores

Memory Hierarchy



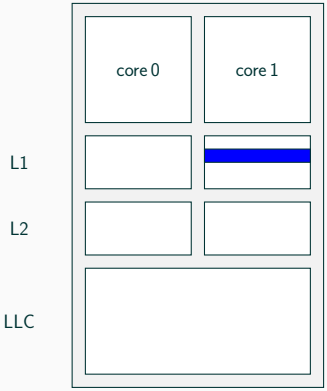
- L1 and L2 are private
- last-level cache:
  - divided in **slices**
  - **shared** across cores
  - **inclusive**

Inclusive property



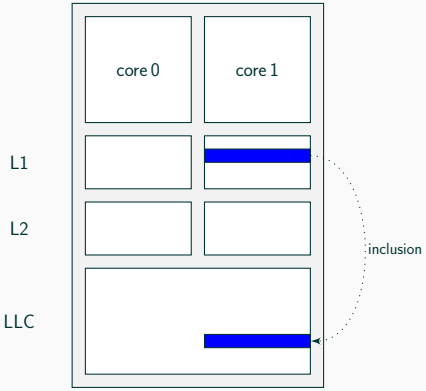
- **inclusive** LLC: superset of L1 and L2

Inclusive property



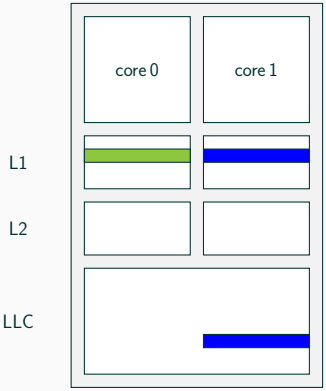
- **inclusive** LLC: superset of L1 and L2

Inclusive property



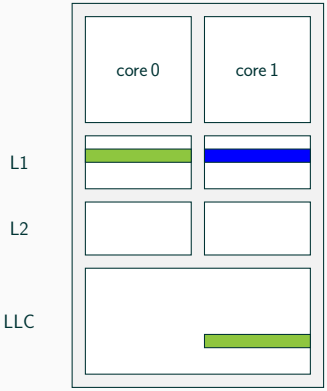
- **inclusive** LLC: superset of L1 and L2

Inclusive property



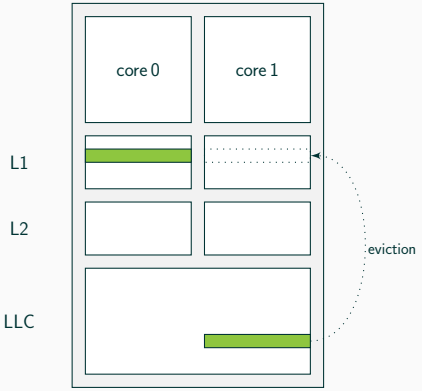
- **inclusive** LLC: superset of L1 and L2

Inclusive property



- **inclusive** LLC: superset of L1 and L2
- data evicted from the LLC is also evicted from L1 and L2

Inclusive property



- **inclusive** LLC: superset of L1 and L2
- data evicted from the LLC is also evicted from L1 and L2
- a core can **evict lines** in the private L1 **of another core**

Side-channel attack on user input

- Locate **key-dependent** memory accesses

Side-channel attack on user input

- Locate **key-dependent** memory accesses
- How?

Profiling Phase

- Preprocessing step to find exploitable addresses automatically

Profiling Phase

- Preprocessing step to find exploitable addresses automatically
  - w.r.t. “events” (keystrokes, encryptions, ...)

Profiling Phase

  - w.r.t. “events” (keystrokes, encryptions, ...)
  - called “Cache Template”

Profiling Phase

- Preprocessing step to find exploitable addresses automatically
  - w.r.t. “events” (keystrokes, encryptions, ...)
  - called “Cache Template”

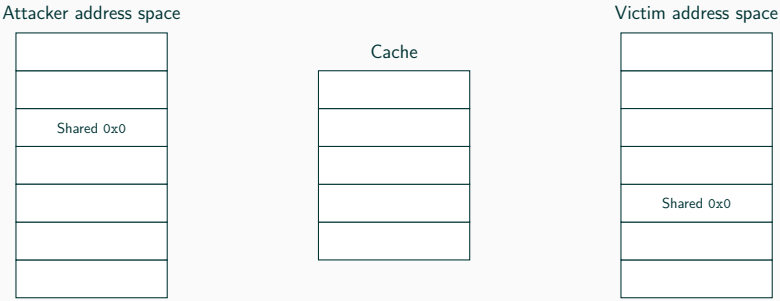
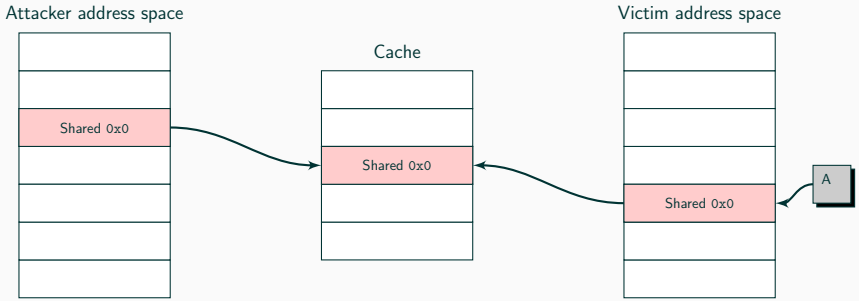
Exploitation Phase

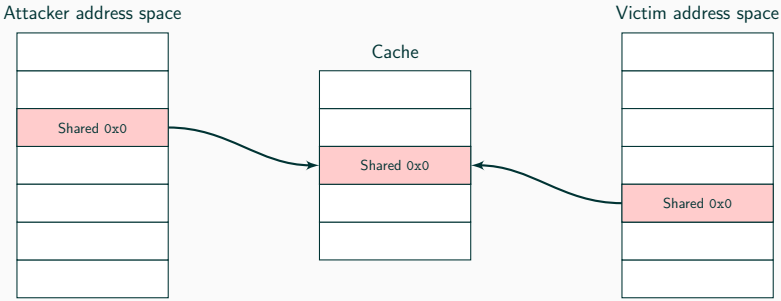
- Monitor exploitable addresses



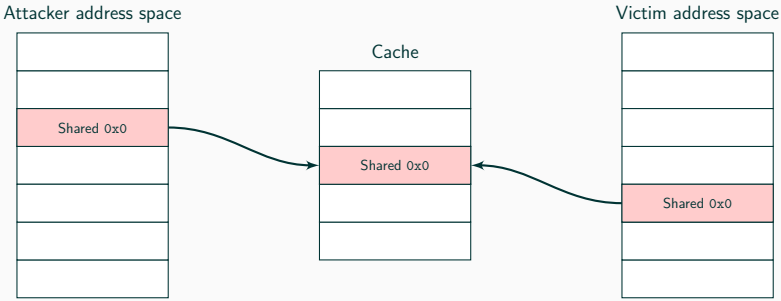
Cache is empty



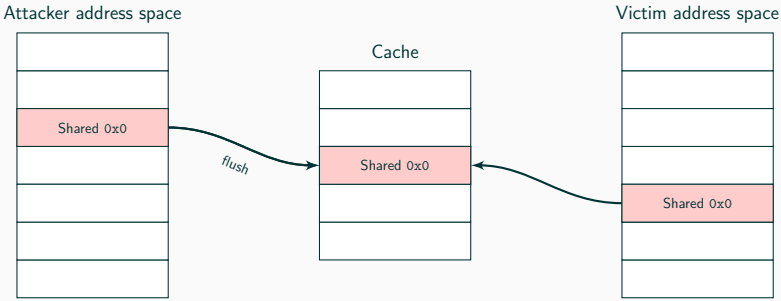
Attacker triggers an event



Attacker checks one address for cache hits ("Reload")

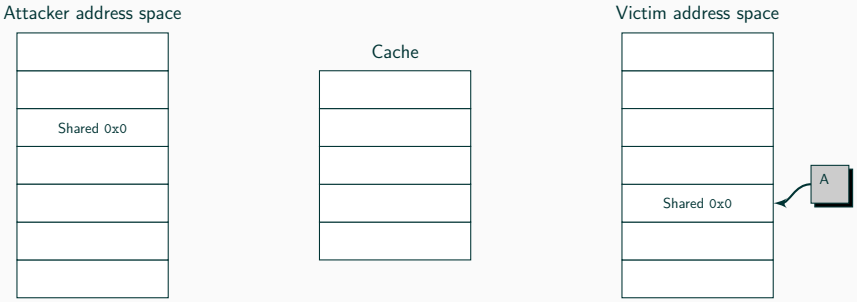


Update number of cache hits per event

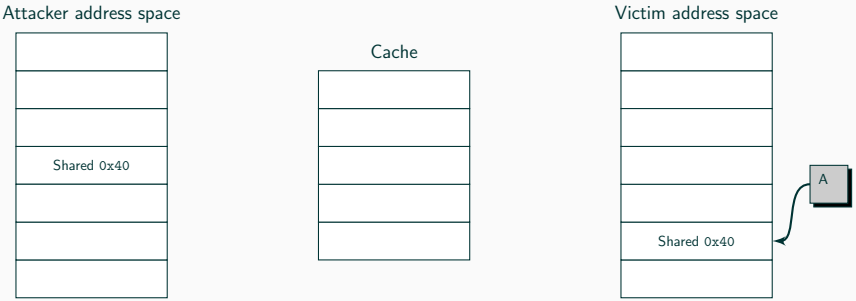


Attacker flushes shared memory

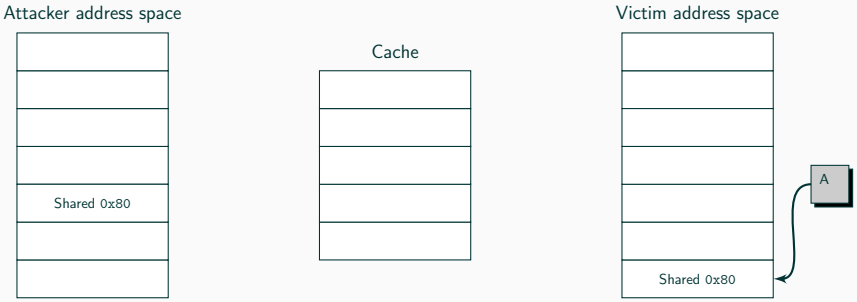
Profiling Phase



Repeat for higher accuracy



Continue with next address



Continue with next address

Pros: less restrictive

1. no need for `clflush` instruction (not available e.g., in JS)

Pros: less restrictive

1. no need for `clflush` instruction (not available e.g., in JS)
2. no need for shared memory

Pros: less restrictive

1. no need for `clflush` instruction (not available e.g., in JS)
2. no need for shared memory

Pros: less restrictive

1. no need for `clflush` instruction (not available e.g., in JS)
2. no need for shared memory

Cons: coarser granularity (1 set)

- Paging: memory translated page-wise from virtual to physical

TLB and Paging

- Paging: memory translated page-wise from virtual to physical
- TLB (translation lookaside buffer) caches virtual to physical mapping

TLB and Paging

- Paging: memory translated page-wise from virtual to physical
- TLB (translation lookaside buffer) caches virtual to physical mapping
- TLB has some latency

- Paging: memory translated page-wise from virtual to physical
- TLB (translation lookaside buffer) caches virtual to physical mapping
- TLB has some latency
- Worst case for Cache: mapping not in TLB, need to load mapping from RAM

- Paging: memory translated page-wise from virtual to physical
- TLB (translation lookaside buffer) caches virtual to physical mapping
- TLB has some latency
- Worst case for Cache: mapping not in TLB, need to load mapping from RAM
- Solution: Use virtual addresses instead of physical addresses

Cache indexing methods

- VIVT: Virtually indexed, virtually tagged

Cache indexing methods

- VIVT: Virtually indexed, virtually tagged
- PIPT: Physically indexed, physically tagged

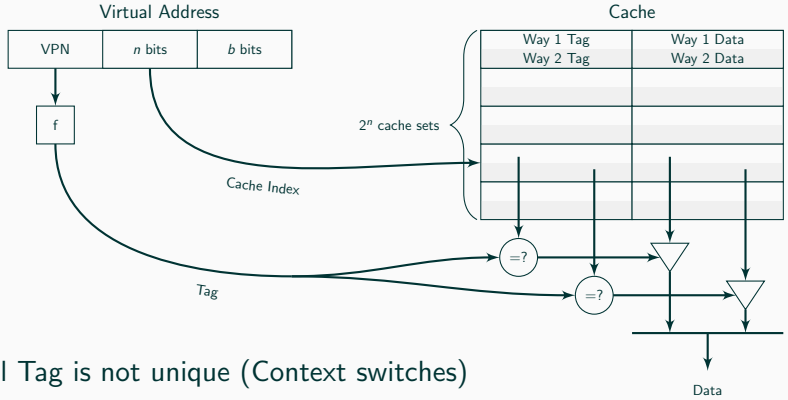
- Fast



- Fast
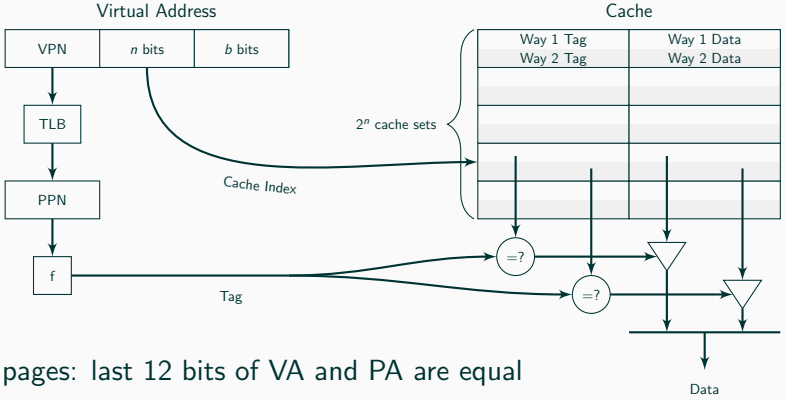
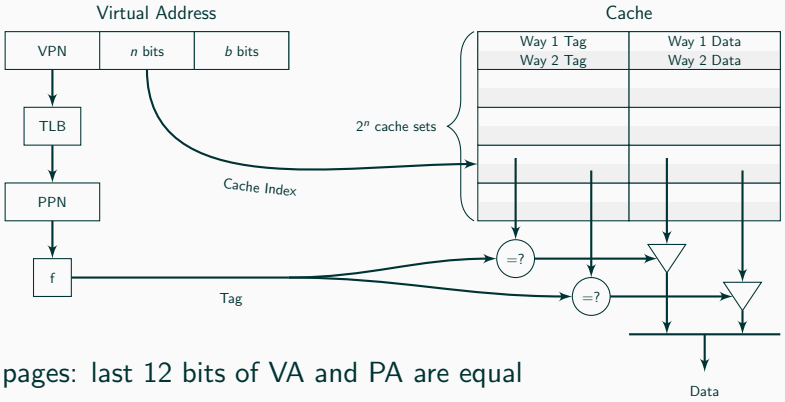
- 4 KiB pages: last 12 bits of VA and PA are equal



- Fast
- 4 KiB pages: last 12 bits of VA and PA are equal
- Using more bits is unpractical (like VIVT)



- Fast
- 4 KiB pages: last 12 bits of VA and PA are equal
- Using more bits is unpractical (like VIVT)

$\rightarrow$ Cache size $\leq$ # ways $\cdot$ page size

- L1 caches: VIVT or VIPT

- L1 caches: VIVT or VIPT
- L2/L3 caches: PIPT

We need to evict cache lines without `clflush` or shared memory:

1. which addresses do we access to have congruent cache lines?

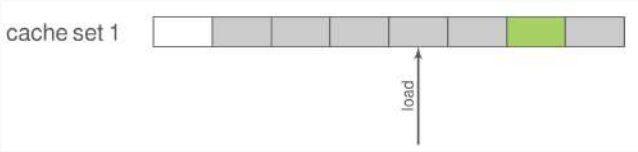
Issues with Prime+Probe

We need to evict cache lines without `clflush` or shared memory:

1. which addresses do we access to have congruent cache lines?
2. without any privilege?

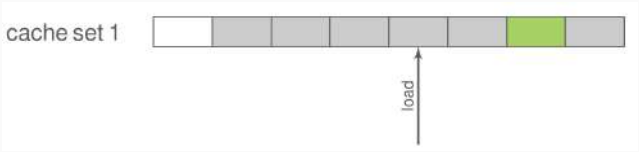
We need to evict cache lines without `clflush` or shared memory:

1. which addresses do we access to have congruent cache lines?
2. without any privilege?
3. and in which order do we access them?



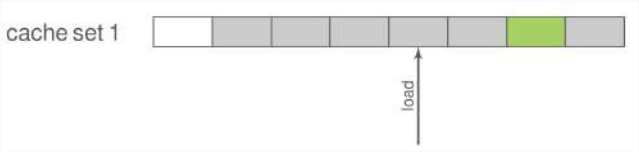
"LRU eviction":

- assume that cache uses LRU replacement



"LRU eviction":

- assume that cache uses LRU replacement
- accessing n **addresses from the same cache set** to evict an n-way set

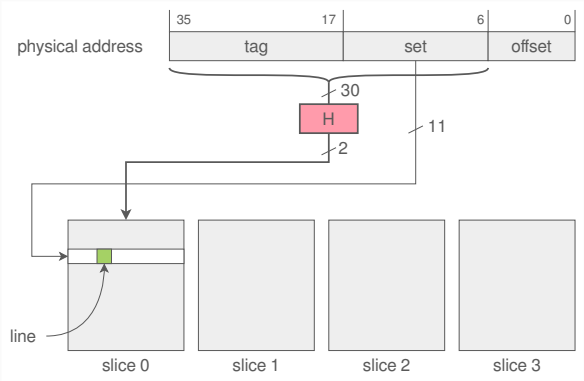


"LRU eviction":

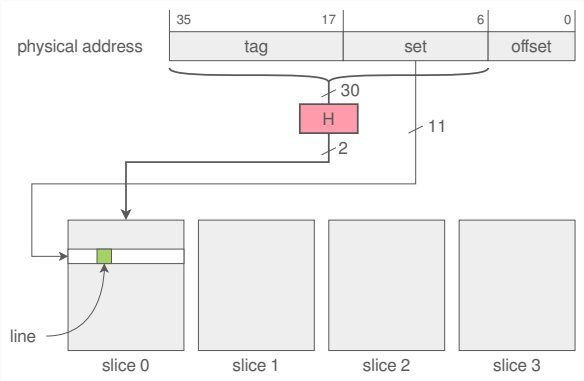
- assume that cache uses LRU replacement
- accessing n **addresses from the same cache set** to evict an n-way set
- eviction from last level $\rightarrow$ from whole hierarchy (it's inclusive!)

#1.2: Which addresses map to the same set?

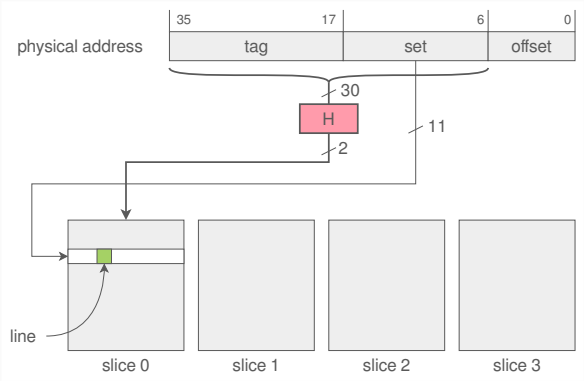
#1.2: Which addresses map to the same set?



#1.2: Which addresses map to the same set?

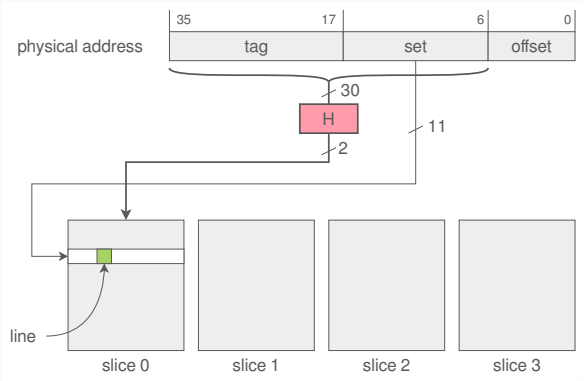


#1.2: Which addresses map to the same set?



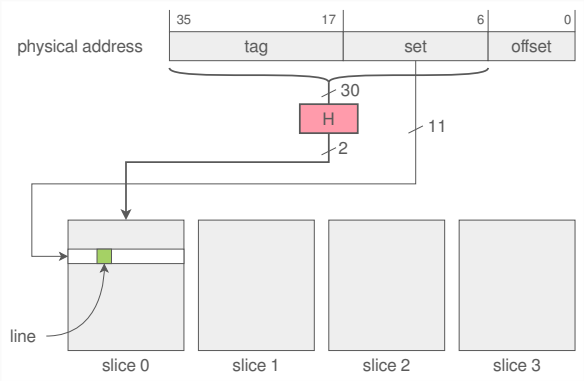
- function H that maps slices is undocumented

#1.2: Which addresses map to the same set?



- function H that maps slices is undocumented
- **reverse-engineered** by Maurice et al

#1.2: Which addresses map to the same set?



- function H that maps slices is undocumented
- **reverse-engineered** by Maurice et al
- hash function basically an XOR of address bits

#1.2: Which addresses map to the same set?

3 functions, depending on the number of cores

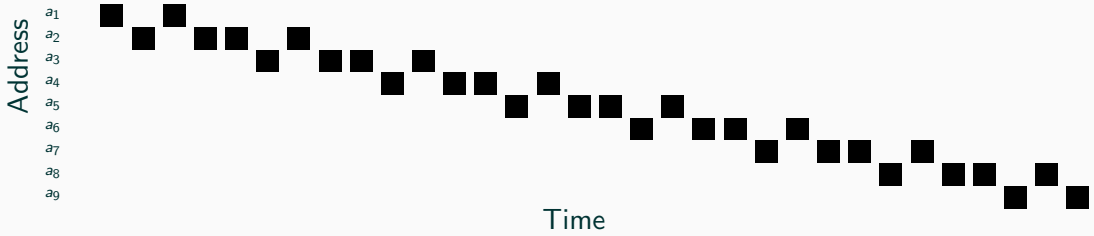
- only 75% success rate on Haswell

"LRU eviction" memory accesses

- no LRU replacement
- only 75% success rate on Haswell
- more accesses → higher success rate, but **too slow**



$\rightarrow$ fast and effective on Haswell: eviction rate >99.97%

Cache eviction strategy: New representation

- represent accesses as a sequence of numbers: $1, 2, 1, 2, 2, 3, 2, 3, 3, 4, 3, 4, \ldots$

Cache eviction strategy: New representation

- represent accesses as a sequence of numbers: $1, 2, 1, 2, 2, 3, 2, 3, 3, 4, 3, 4, \ldots$
- can be a long sequence

Cache eviction strategy: New representation

- represent accesses as a sequence of numbers: $1, 2, 1, 2, 2, 3, 2, 3, 3, 4, 3, 4, \ldots$
- can be a long sequence
- all congruent addresses are indistinguishable w.r.t eviction strategy

Cache eviction strategy: New representation

- represent accesses as a sequence of numbers: $1, 2, 1, 2, 2, 3, 2, 3, 3, 4, 3, 4, \ldots$
- can be a long sequence
- all congruent addresses are indistinguishable w.r.t eviction strategy

$\rightarrow$ adding more **unique** addresses can increase eviction rate

Cache eviction strategy: New representation

- represent accesses as a sequence of numbers: $1, 2, 1, 2, 2, 3, 2, 3, 3, 4, 3, 4, \ldots$
- can be a long sequence
- all congruent addresses are indistinguishable w.r.t eviction strategy

$\rightarrow$ adding more **unique** addresses can increase eviction rate

$\rightarrow$ **multiple** accesses to one address can increase the eviction rate

Cache eviction strategy: New representation

- represent accesses as a sequence of numbers: $1, 2, 1, 2, 2, 3, 2, 3, 3, 4, 3, 4, \ldots$
- can be a long sequence
- all congruent addresses are indistinguishable w.r.t eviction strategy

$\rightarrow$ adding more **unique** addresses can increase eviction rate

$\rightarrow$ **multiple** accesses to one address can increase the eviction rate

- indistinguishable $\rightarrow$ **balanced** number of accesses

Cache eviction strategy: Notation (1)

Write eviction strategies as: *P-C-D-L-S*

```
for (s = 0; s <= S - D; s += L)
  for (c = 0; c <= C; c += 1)
    for (d = 0; d <= D; d += 1)
      *a[s+d];
```

Cache eviction strategy: Notation (1)

Write eviction strategies as: *P-C-D-L-S*

S: total number of different addresses
(= set size)

```
for (s = 0; s <= S - D; s += L)
  for (c = 0; c <= C; c += 1)
    for (d = 0; d <= D; d += 1)
      *a[s+d];
```

Cache eviction strategy: Notation (1)

Write eviction strategies as: *P-C-D-L-S*

S: total number of different addresses (= set size)

D: different addresses per inner access loop

```
for (s = 0; s <= S - D; s += L)
  for (c = 0; c <= C; c += 1)
    for (d = 0; d <= D; d += 1)
      *a[s+d];
```

Cache eviction strategy: Notation (1)

Write eviction strategies as: *P-C-D-L-S*

S: total number of different addresses (= set size)

D: different addresses per inner access loop

```
for (s = 0; s <= S - D; s += L)
  for (c = 0; c <= C; c += 1)
    for (d = 0; d <= D; d += 1)
      *a[s+d];
```

L: step size of the inner access loop

Cache eviction strategy: Notation (1)

Write eviction strategies as: *P-C-D-L-S*

S: total number of different addresses (= set size)

D: different addresses per inner access loop

```
for (s = 0; s <= S - D; s += L)
  for (c = 0; c <= C; c += 1)
    for (d = 0; d <= D; d += 1)
      *a[s+d];
```

L: step size of the inner access loop

C: number of repetitions of the inner access loop

Cache eviction strategy: Notation (2)

```
for (s = 0; s <= S - D; s += L)
  for (c = 1; c <= C; c += 1)

- We want the performance optimizations

Countermeasures are Difficult

- We want the performance optimizations
- Many side-channel attacks exploit intended behavior

Countermeasures are Difficult

- We want the performance optimizations
- Many side-channel attacks exploit intended behavior
- Often a trade-off between security and performance

Countermeasures are Difficult

- We want the performance optimizations
- Many side-channel attacks exploit intended behavior
- Often a trade-off between security and performance
- Every optimization is potentially a side channel

- We won't get rid of side channels

The Future

- We won't get rid of side channels
- More optimizations $\rightarrow$ more side channels

- We won't get rid of side channels
- More optimizations $\rightarrow$ more side channels
- But: low hanging fruits will disappear

Introduction to Microarchitectural Attacks

Daniel Gruss
