Post-quantum cryptography

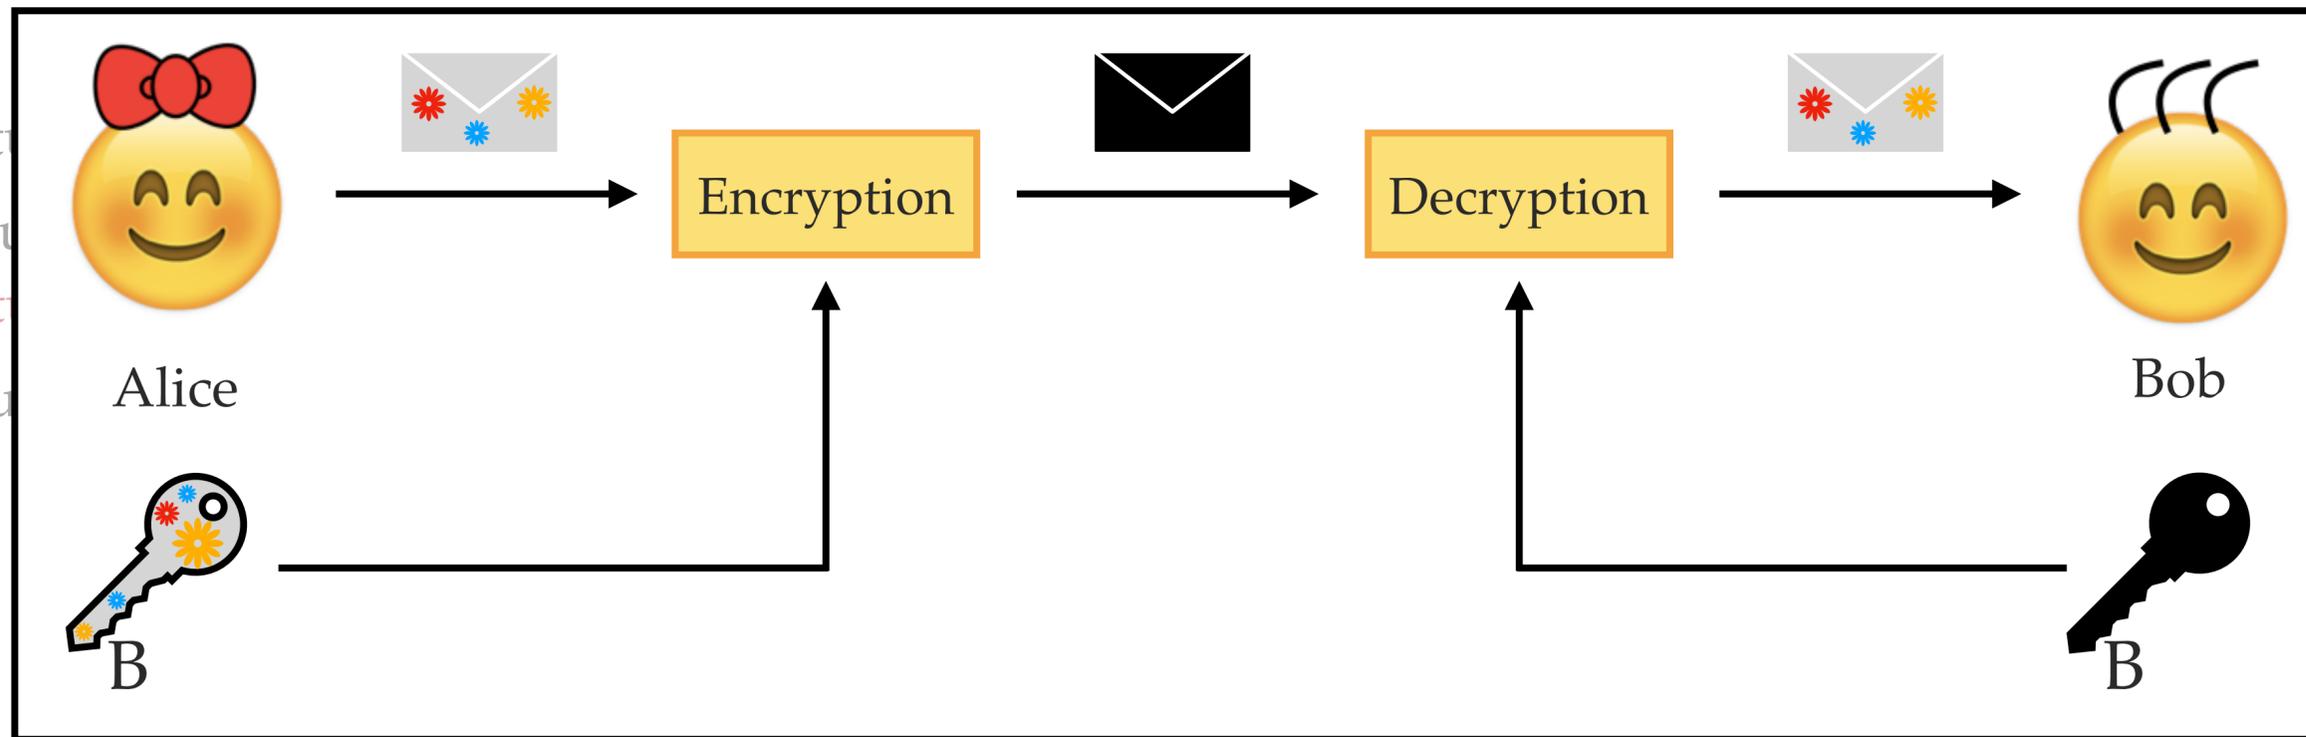

Implemented on a classical, but resistant to attacks on a quantum computer.

- **Shor's** quantum algorithm: solves integer **factorisation** and **discrete logarithms** in abelian groups in **polynomial** time.
 - ▶ All* currently deployed public-key cryptosystems would be broken by an adversary in possession of a large **quantum** computer.
 - ▶ All public-key cryptosystems need to be **replaced**.

Code-based cryptography

Lattice-based cryptography

Isogeny-based cryptography

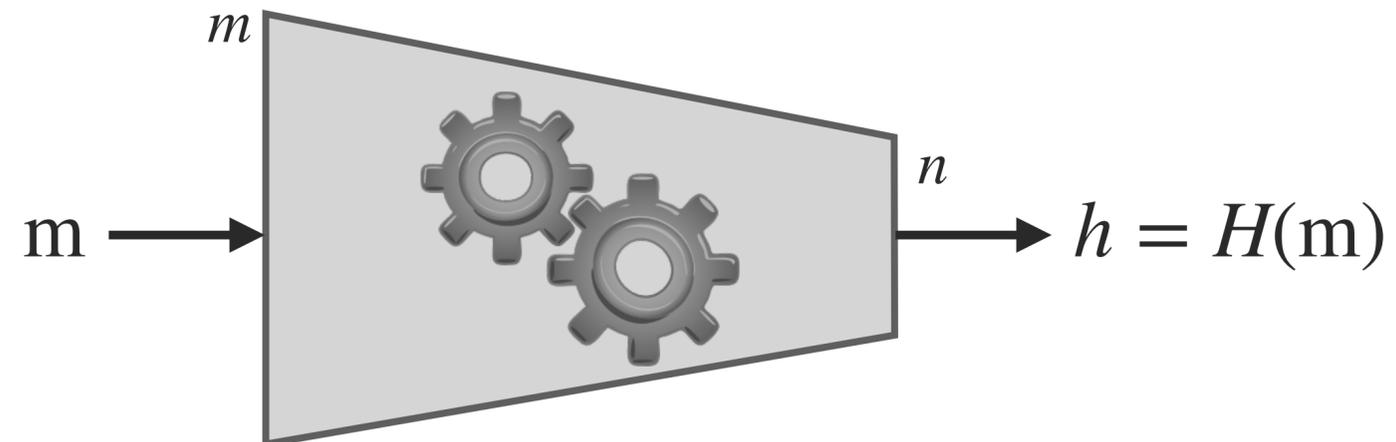

Hash-based cryptography

Hash-based cryptography

↪ Worst-case complexity: $\mathcal{O}(2^n)$

➔ Hard problem: find a pre-image of h .

➔ Used to build digital signature schemes with only **one security assumption**.

Multivariate cryptography

Multivariate cryptography

The MQ problem

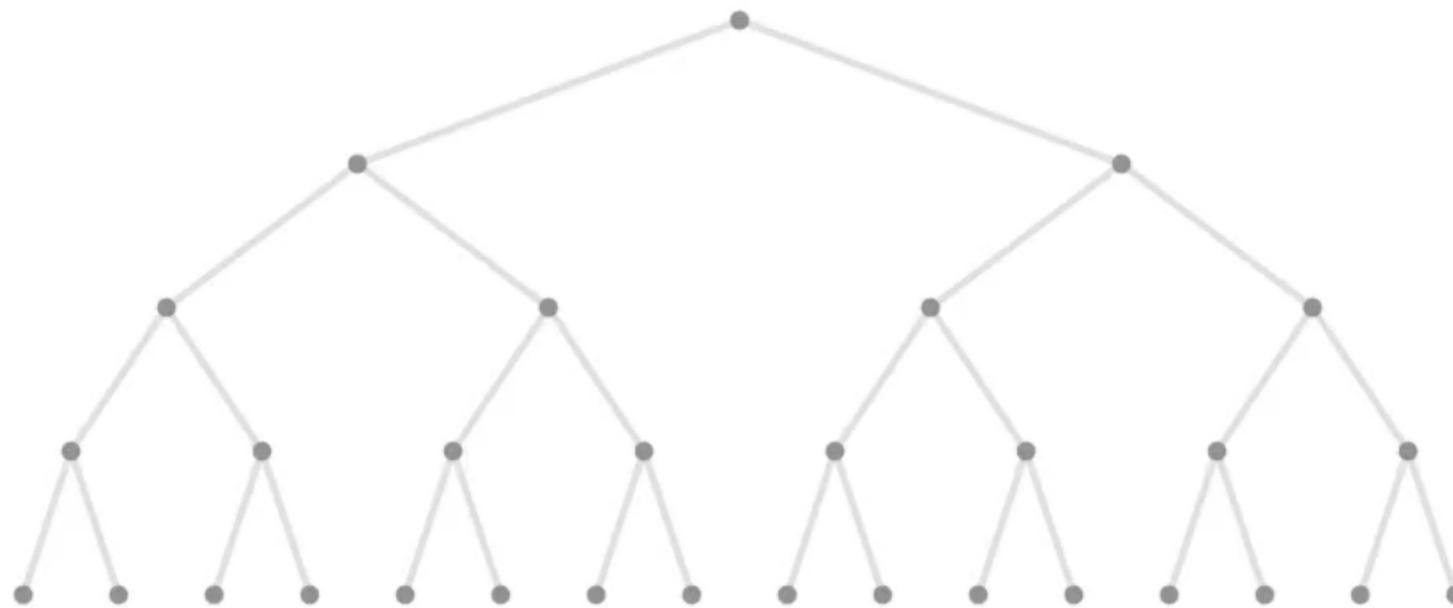

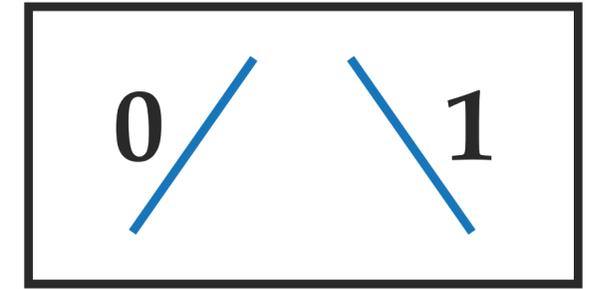

Input: m multivariate quadratic polynomials f_1, \dots, f_m of n variables over a finite field \mathbb{F}_q .

Question: find a tuple $\mathbf{x} = (x_1, \dots, x_n)$ in \mathbb{F}_q^n such that $f_1(\mathbf{x}) = \dots = f_m(\mathbf{x}) = 0$.

Example.

$$f_1 : x_1x_3 + x_2x_4 + x_1 + x_3 + x_4 = 0$$
$$f_2 : x_2x_3 + x_1x_4 + x_3x_4 + x_1 + x_2 + x_4 = 0$$
$$f_3 : x_2x_4 + x_3x_4 + x_1 + x_3 + 1 = 0$$
$$f_4 : x_1x_2 + x_1x_3 + x_2x_3 + x_3 + x_4 + 1 = 0$$
$$f_5 : x_1x_2 + x_2x_3 + x_1x_4 + x_3 = 0$$
$$f_6 : x_1x_3 + x_1x_4 + x_3x_4 + x_1 + x_2 + x_3 + x_4 = 0$$

Multivariate cryptography

$$x_1 \cdot x_2 + x_1 \cdot x_3 + x_3 \cdot x_4 + x_3 = 0$$

$$x_2 \cdot x_3 + x_2 \cdot x_4 + x_1 + x_2 + 1 = 0$$

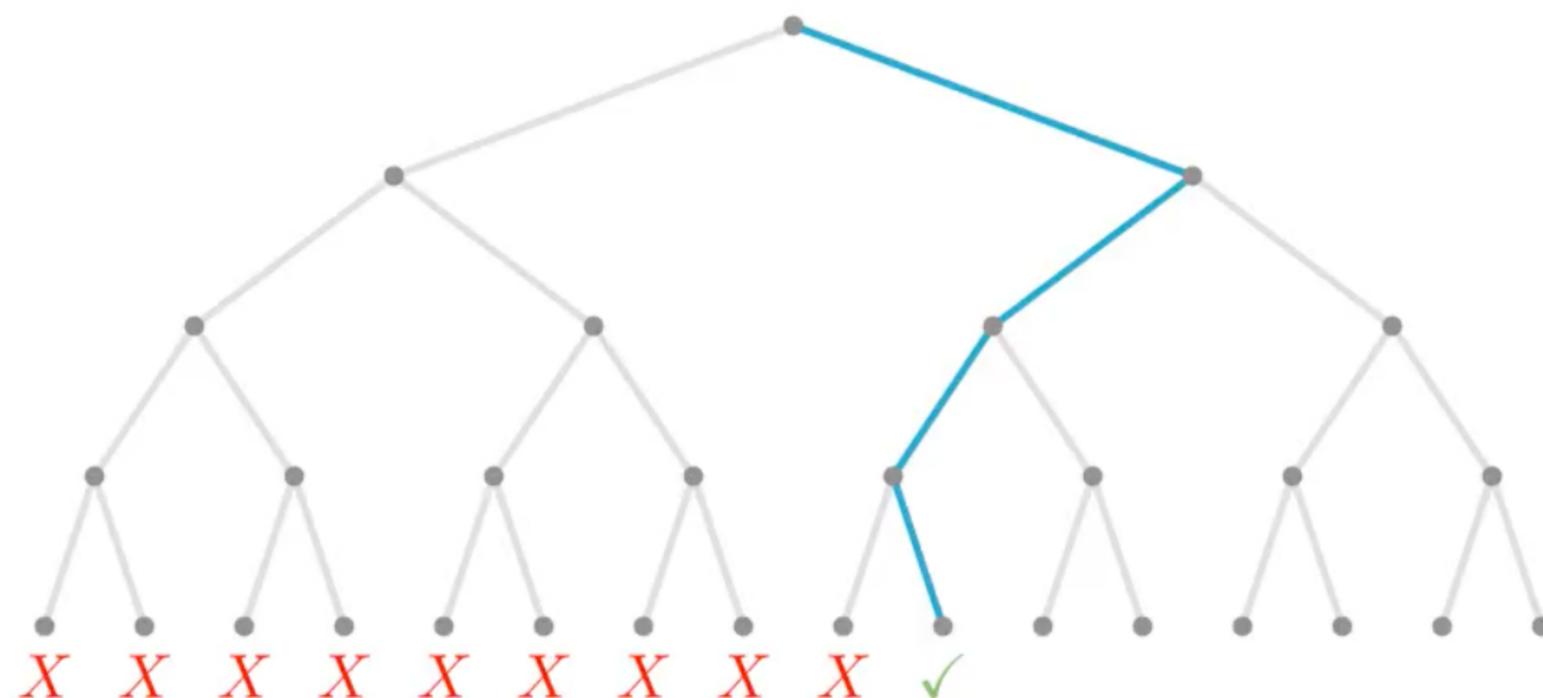

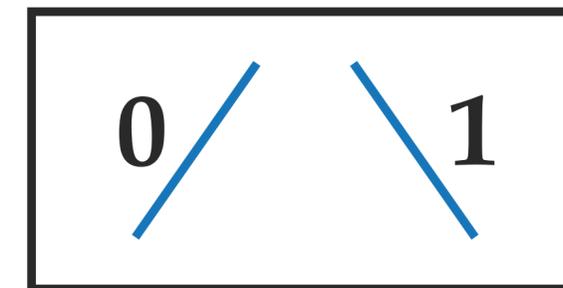

$$x_1 \cdot x_2 + x_2 \cdot x_3 + x_2 \cdot x_4 + x_1 + x_4 = 0$$

$$x_1 \cdot x_4 + x_2 \cdot x_3 + x_2 + x_3 + x_4 = 0$$

Binary search tree

Multivariate cryptography

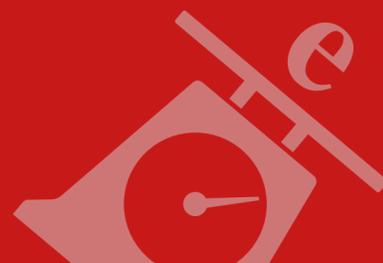

Worst-case complexity: $\mathcal{O}(2^n)$

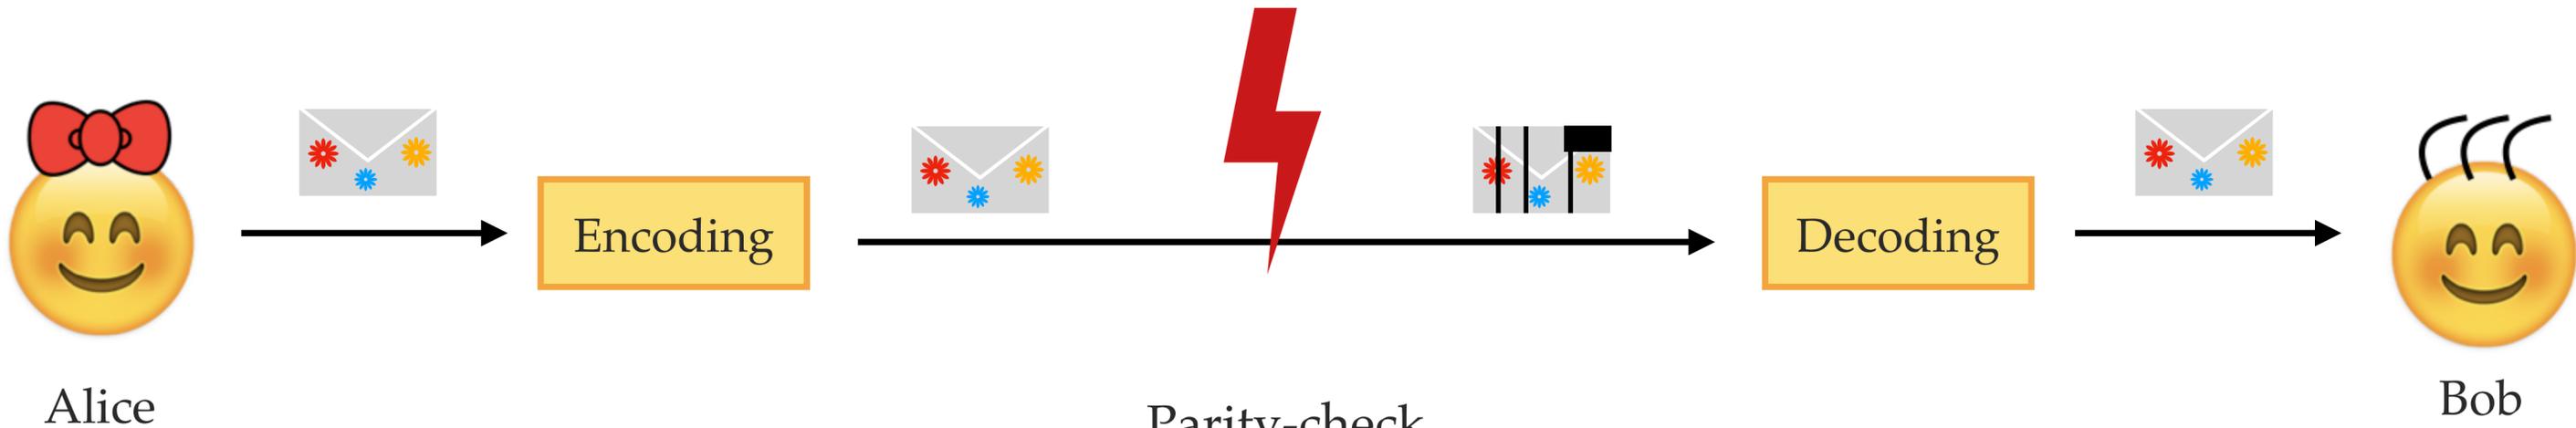

$$\begin{aligned} 1 \cdot 0 + 1 \cdot 0 + 0 \cdot 1 + 0 &= 0 \\ 0 \cdot 0 + 0 \cdot 1 + 1 + 0 + 1 &= 0 \\ 1 \cdot 0 + 0 \cdot 0 + 0 \cdot 1 + 1 + 1 &= 0 \\ 1 \cdot 1 + 0 \cdot 0 + 0 + 0 + 1 &= 0 \end{aligned}$$

Binary search tree

Code-based cryptography

Code-based cryptography

Small **error**:
Hamming weight is t

Parity-check matrix

$\mathbf{Hc} = \mathbf{0}$

Codeword: it is in the kernel of \mathbf{H}

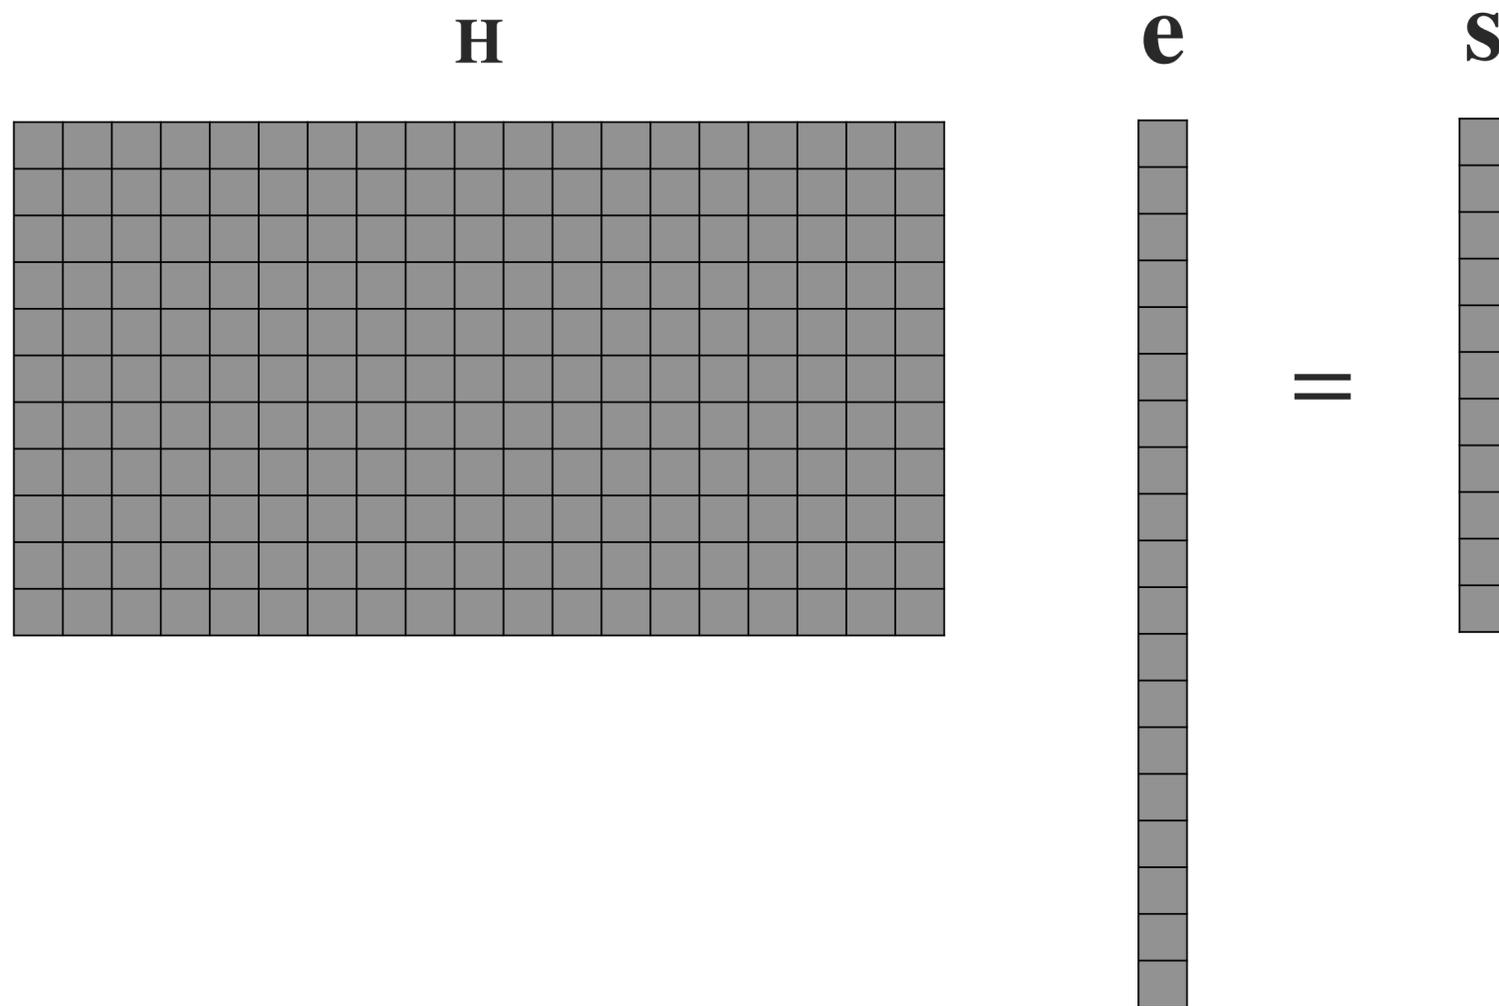

$\mathbf{H(c + e)} = \mathbf{Hc} + \mathbf{He} = \mathbf{0} + \mathbf{He} = \mathbf{He} = \mathbf{s}$

Syndrome: depends only on the error vector.

The syndrome decoding problem

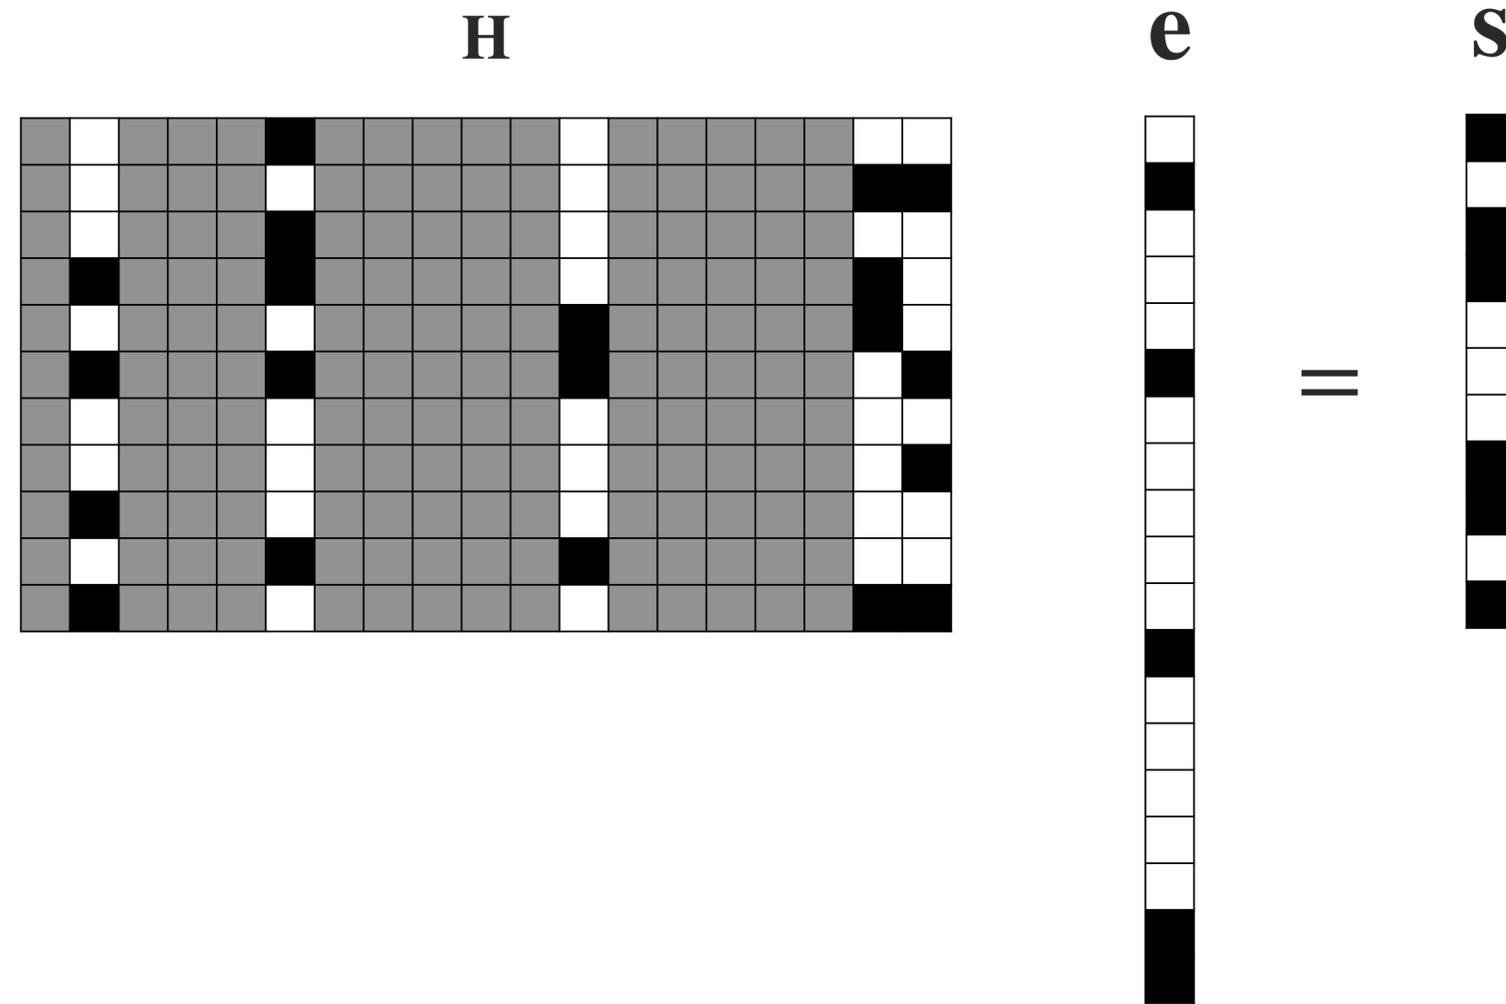

Given a syndrome $\mathbf{s} = \mathbf{He}$, find \mathbf{e} such that $\text{wt}(\mathbf{e}) = t$.

↪ **s** is equal to the sum of the columns where e_i is nonzero.

Code-based cryptography

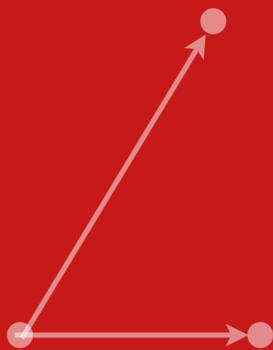

=

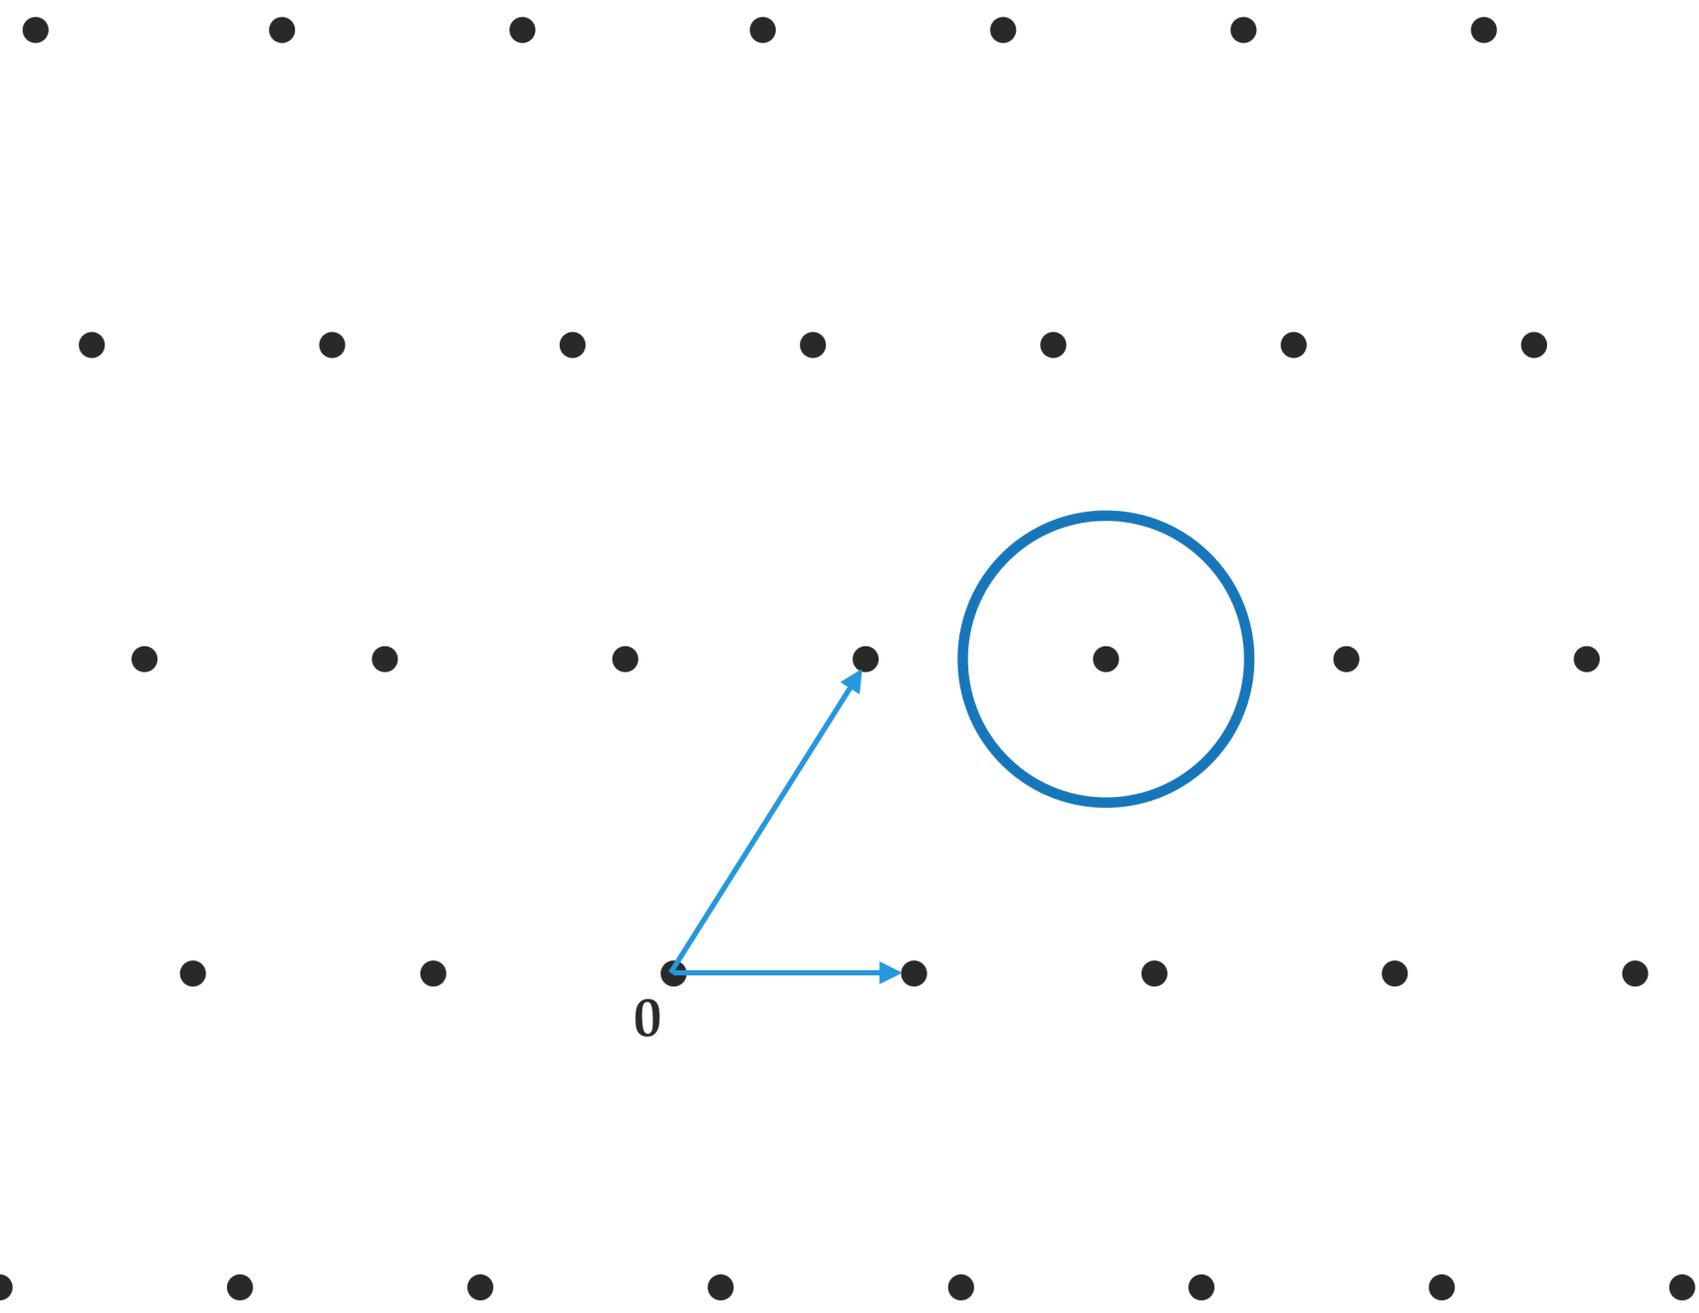

→ Pick any group of t columns of \mathbf{H} , add them and compare with \mathbf{s} .

↪ Cost: $\binom{n}{t}$ sums of t columns.

Lattice-based cryptography

Lattice-based cryptography

A **lattice** $L \subset \mathbb{R}^n$ is a **discrete** subgroup of \mathbb{R}^n .

→ dots: points on the lattice $\mathbf{c} \in L$.

→ for every $\mathbf{v} \in L$, there exists an open ball around \mathbf{v} that contains no other elements from L .

Lattice basis: n \mathbb{R} -linearly independent vectors $\mathbf{b}_1, \dots, \mathbf{b}_n$

$$L := \left\{ \sum_{i=1}^n a_i \mathbf{b}_i \mid a_i \in \mathbb{Z} \right\}$$

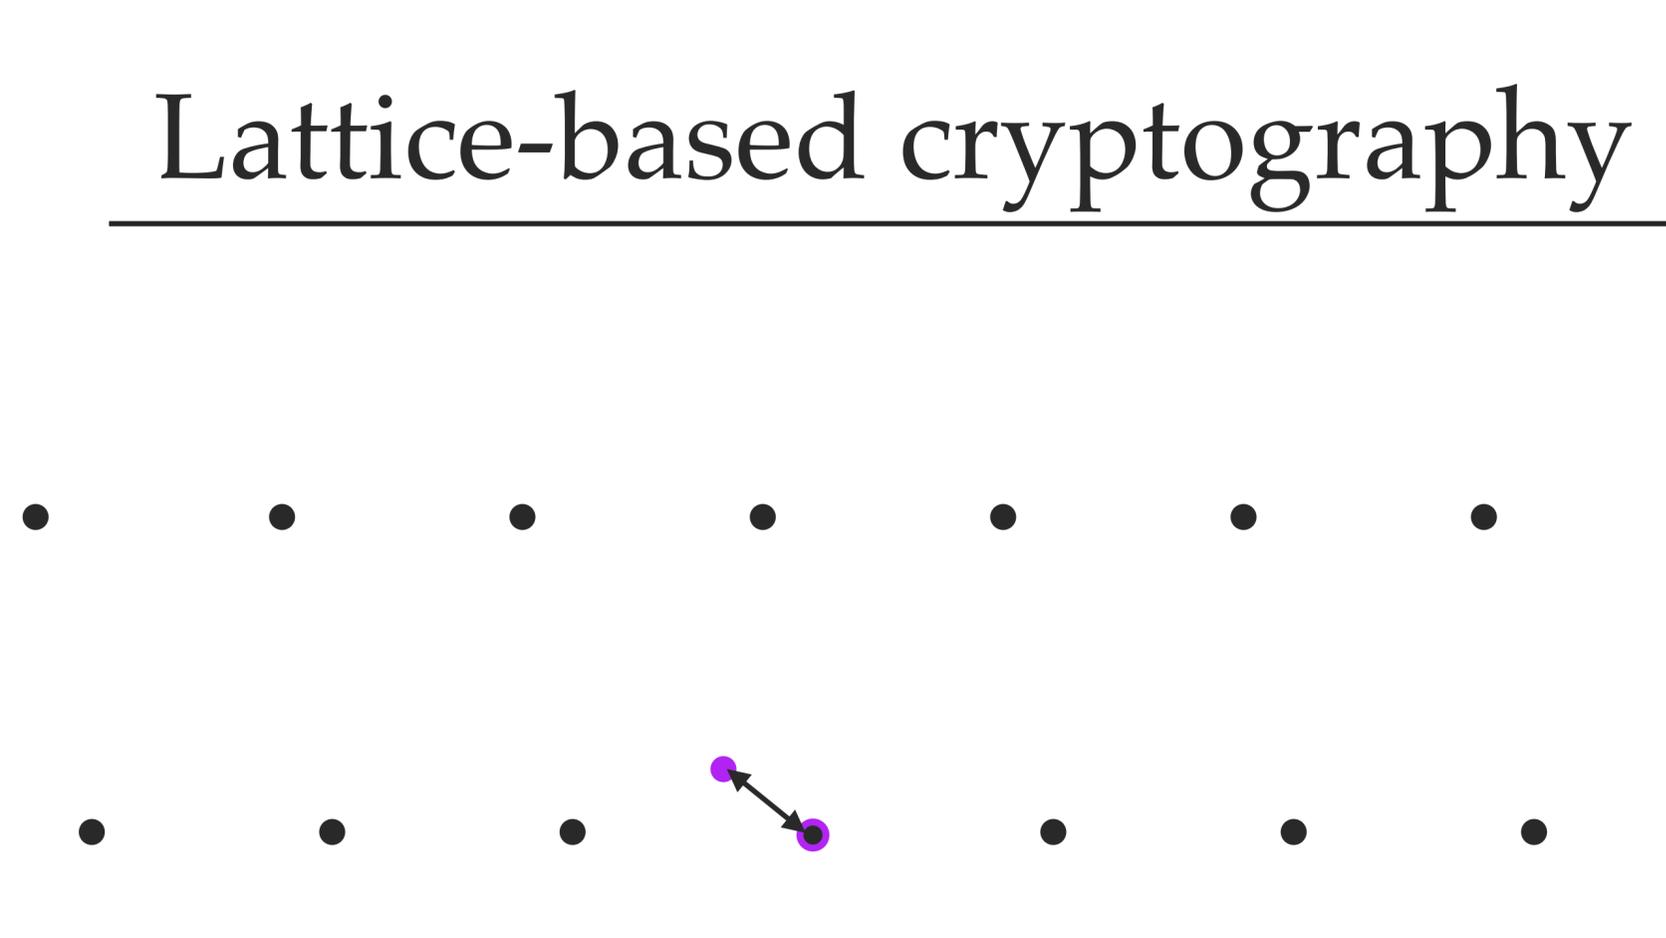

$$\mathbf{B} = \begin{pmatrix} \mathbf{b}_1 \\ \mathbf{b}_2 \end{pmatrix} = \begin{pmatrix} 4 & 0 \\ 3 & 5 \end{pmatrix}$$

Lattice-based cryptography

The Closest Vector Problem (CVP)

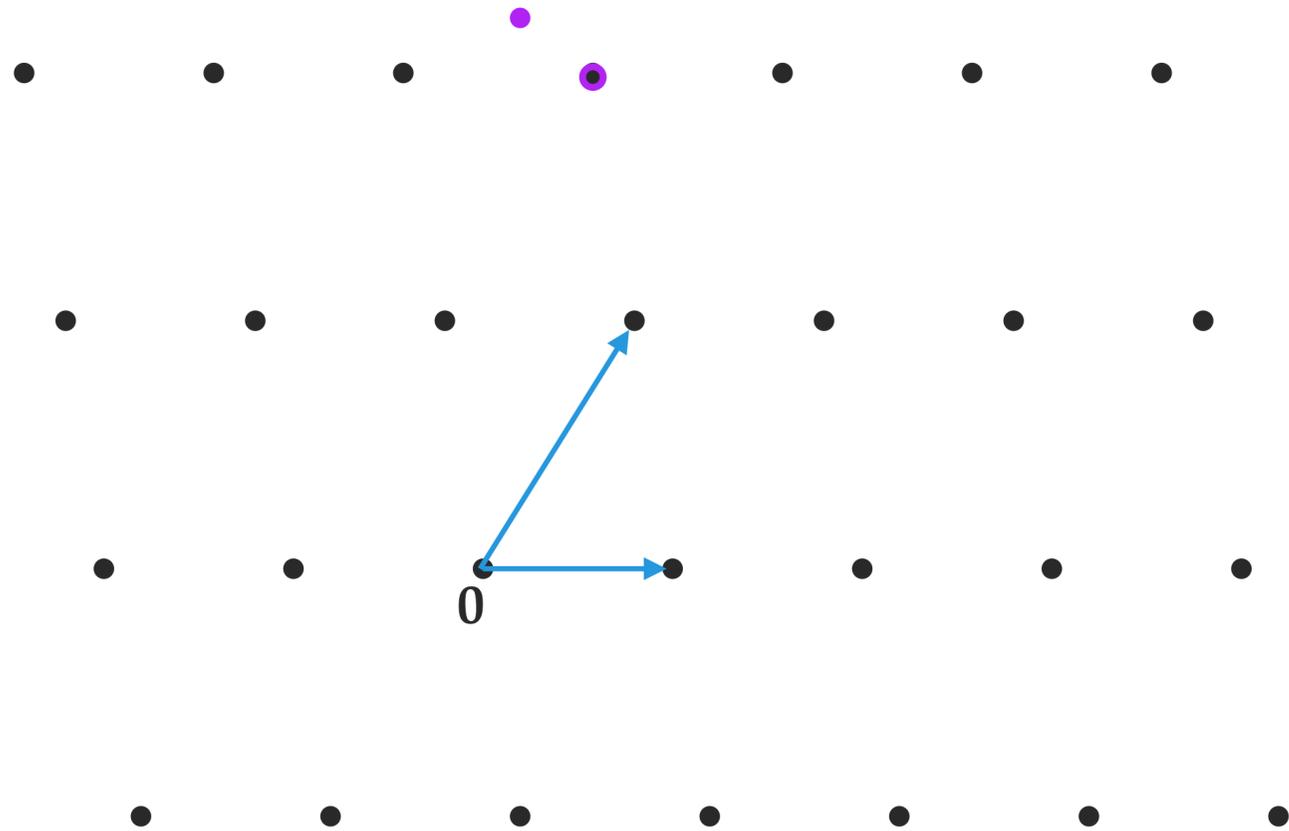

Input: an arbitrary basis \mathbf{B} of a lattice L and a target vector $\mathbf{t} \in \mathbb{R}^n$.

Question: Find a **lattice vector** $\mathbf{v} \in L$ that is closest to \mathbf{t} .

0

Lattice-based cryptography

Good basis

$$(\lambda_1, \lambda_2) \begin{pmatrix} 4 & 0 \\ 3 & 5 \end{pmatrix} = (1, 11)$$

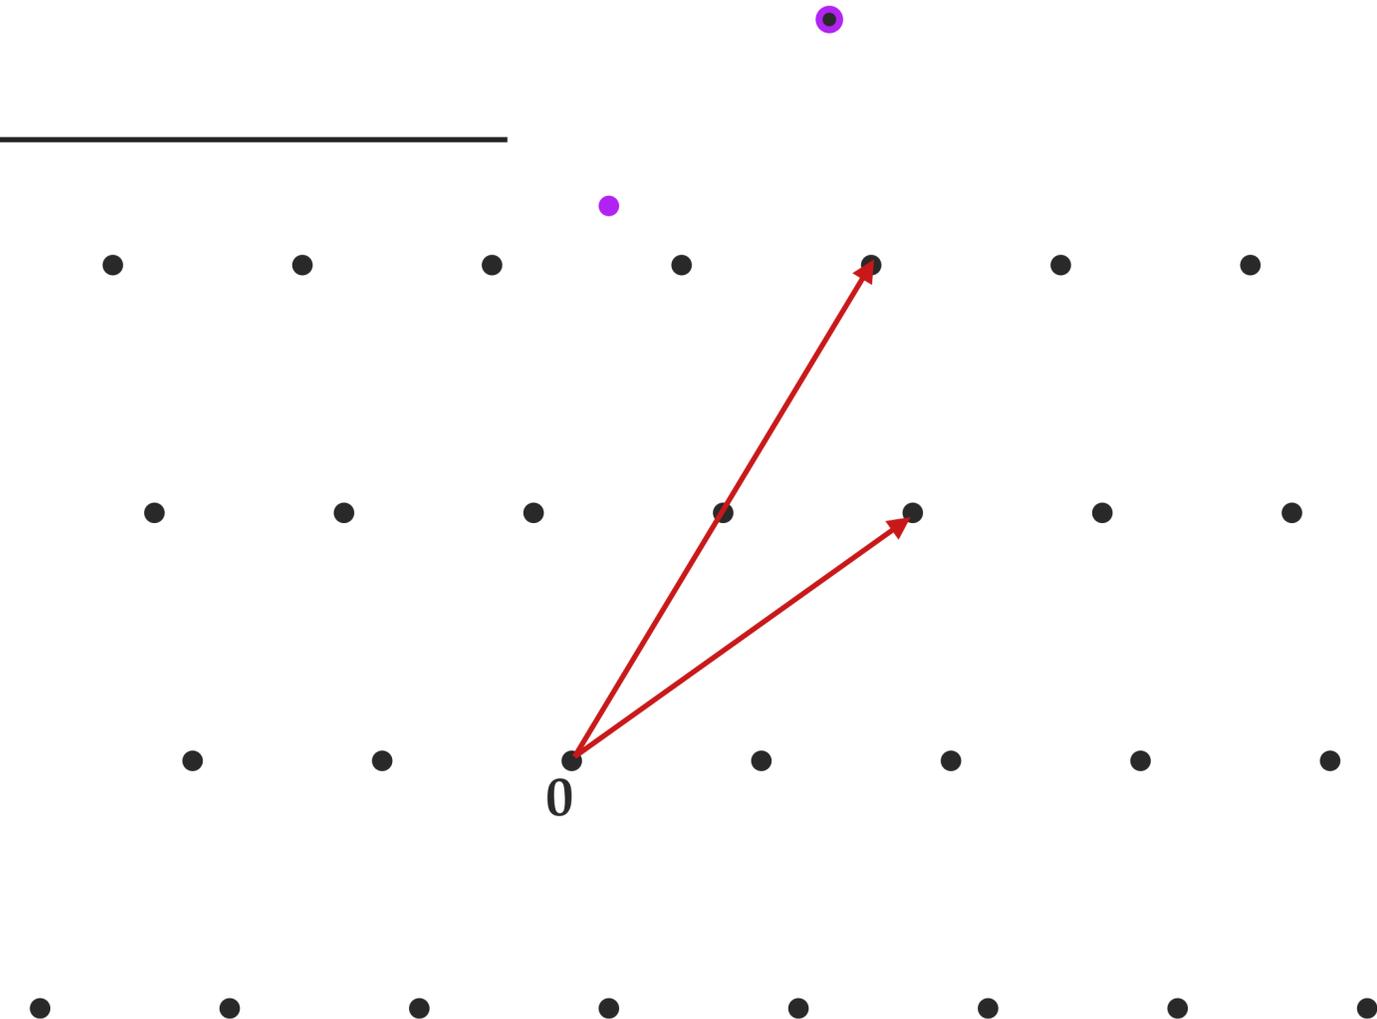

$$\mathbf{t} = -1.4 \mathbf{b}_1 + 2.2 \mathbf{b}_2$$

↓ rounding

$$\mathbf{c} = -1 \mathbf{b}_1 + 2 \mathbf{b}_2 \quad \checkmark$$

Hard problem
←

CVP input $\mathbf{t} = (1, 11)$

Bad basis

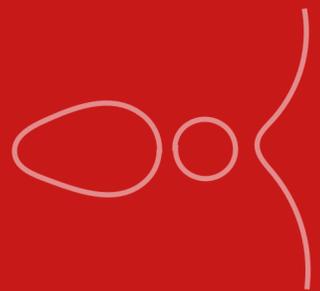

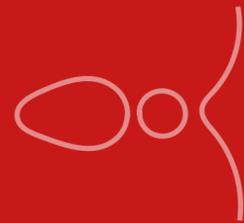

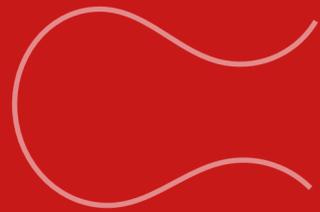

$$(\lambda_1, \lambda_2) \begin{pmatrix} 7 & 5 \\ 6 & 10 \end{pmatrix} = (1, 11)$$

$$\mathbf{t} = -1.4 \mathbf{b}'_1 + 1.8 \mathbf{b}'_2$$

↓ rounding

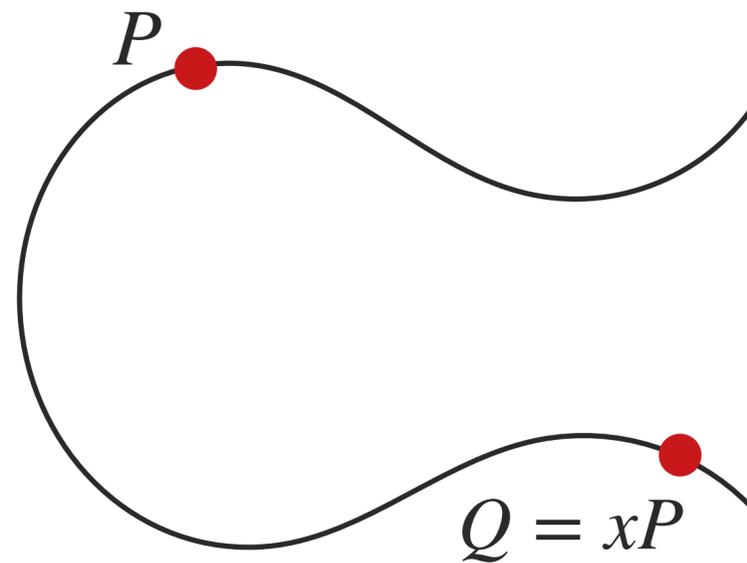

$$\mathbf{c} = -1 \mathbf{b}'_1 + 2 \mathbf{b}'_2 \quad \times$$

Isogeny-based cryptography

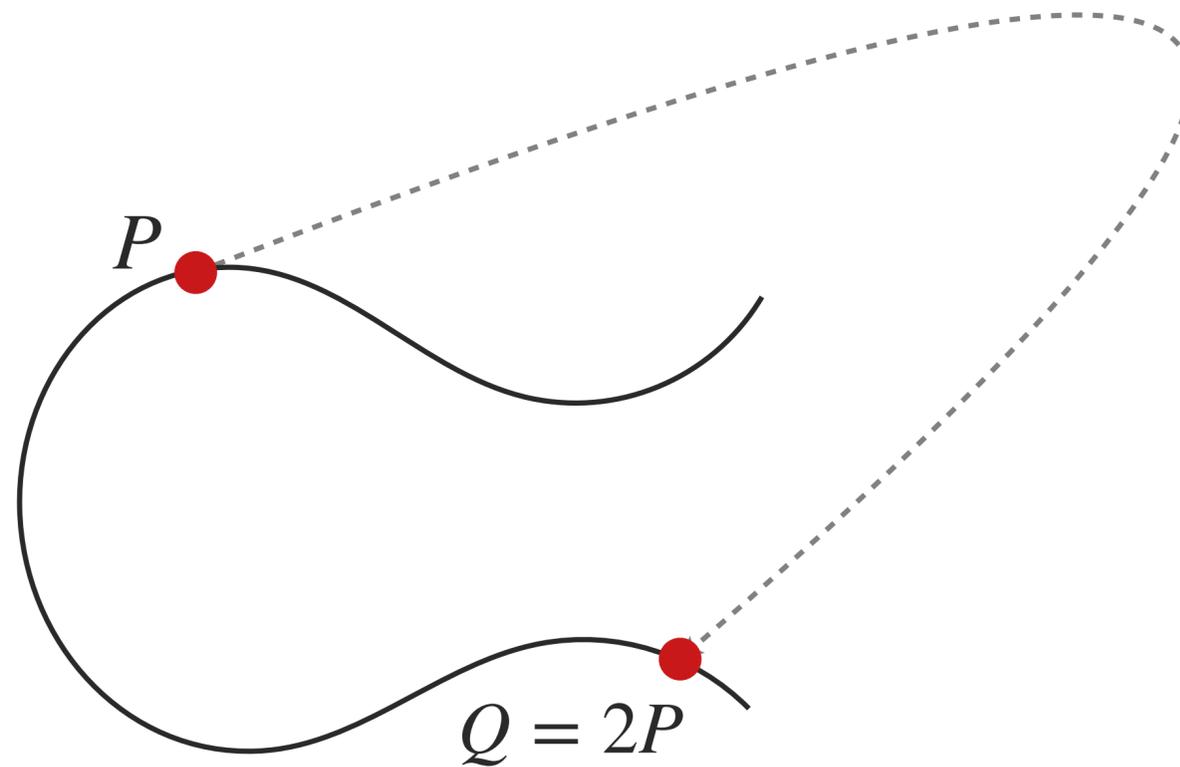

Isogeny-based cryptography

→ Elliptic curves

Isogeny-based cryptography

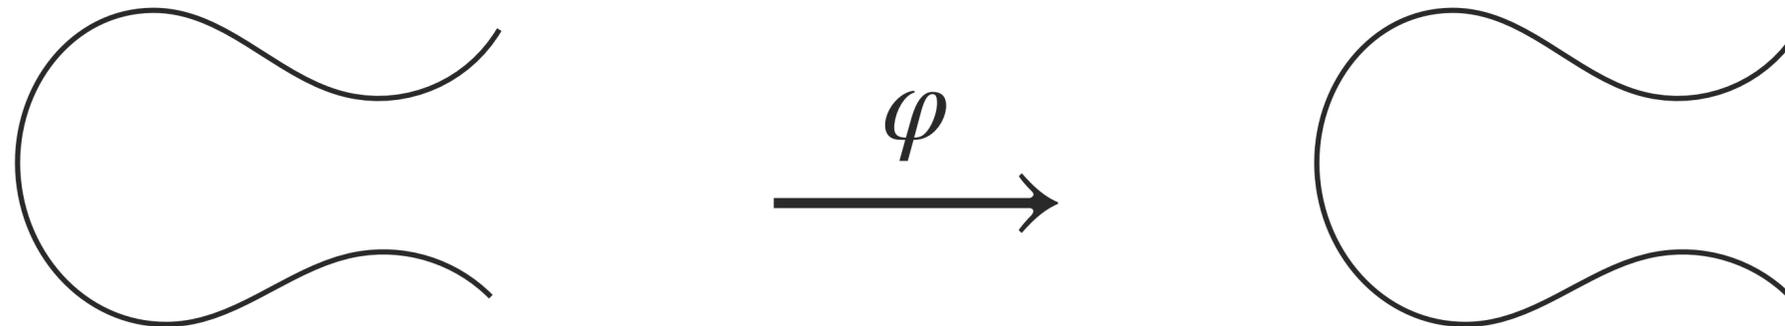

→ Elliptic curves

$$(x, y) \mapsto (\lambda^2 - 2x, \lambda x + y),$$
$$\lambda = \frac{3x^2 + a}{2y}$$

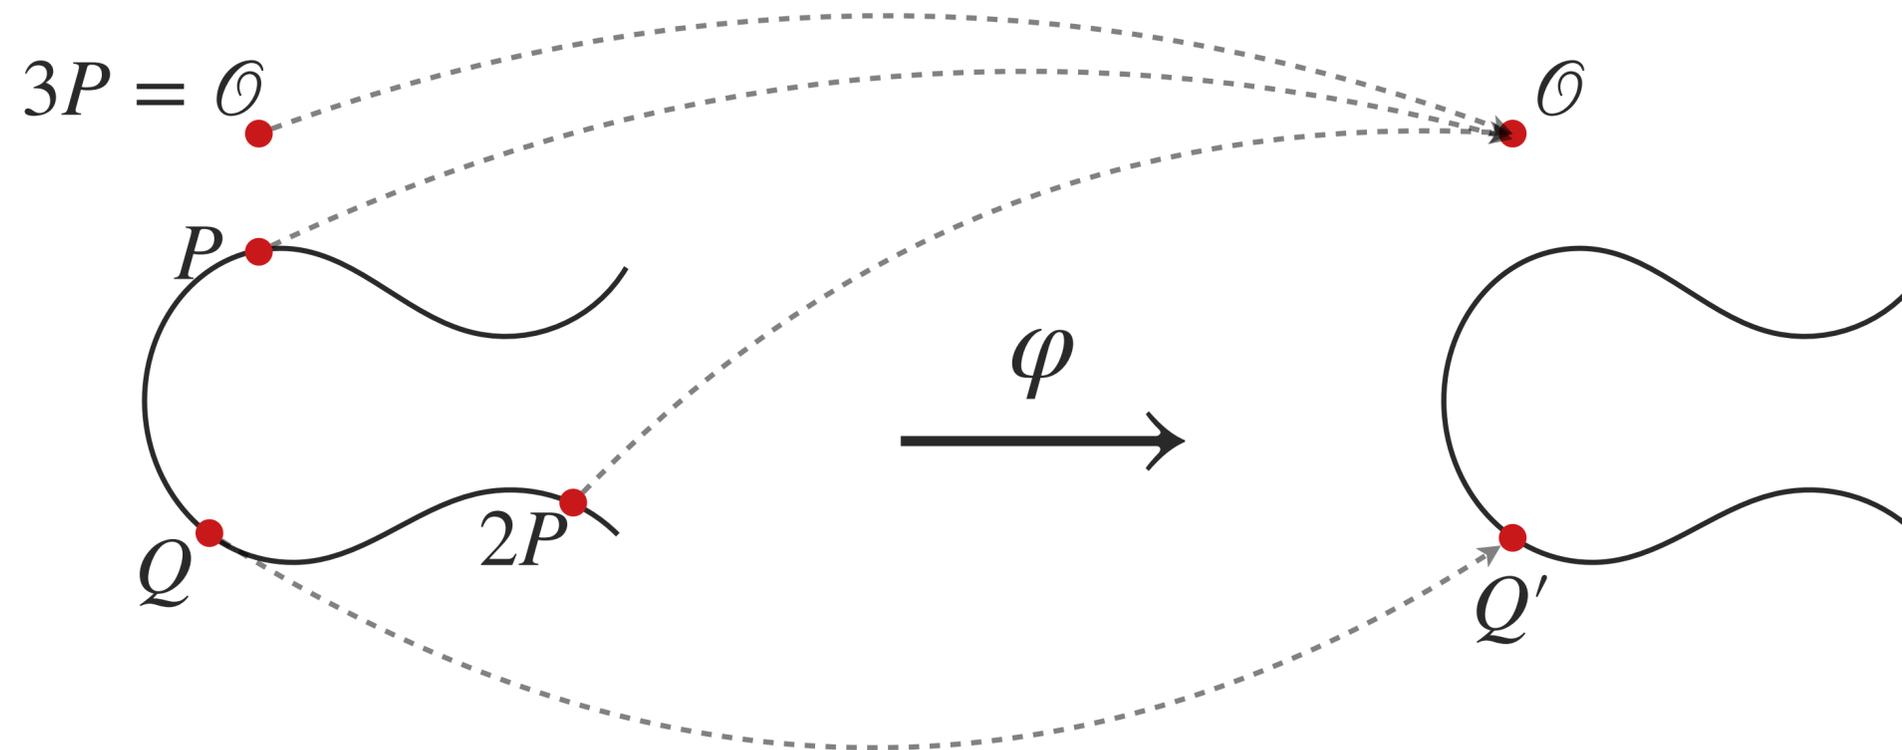

Isogeny-based cryptography

→ Isogenies: maps between elliptic curves

Isogeny-based cryptography

→ Isogenies: maps between elliptic curves

$$(x, y) \mapsto \left(\frac{x^3 - 4x^2 + 30x - 12}{(x - 2)^2}, \frac{x^3 - 6x^2 - 14x + 35}{(x - 2)^3} \cdot y \right)$$

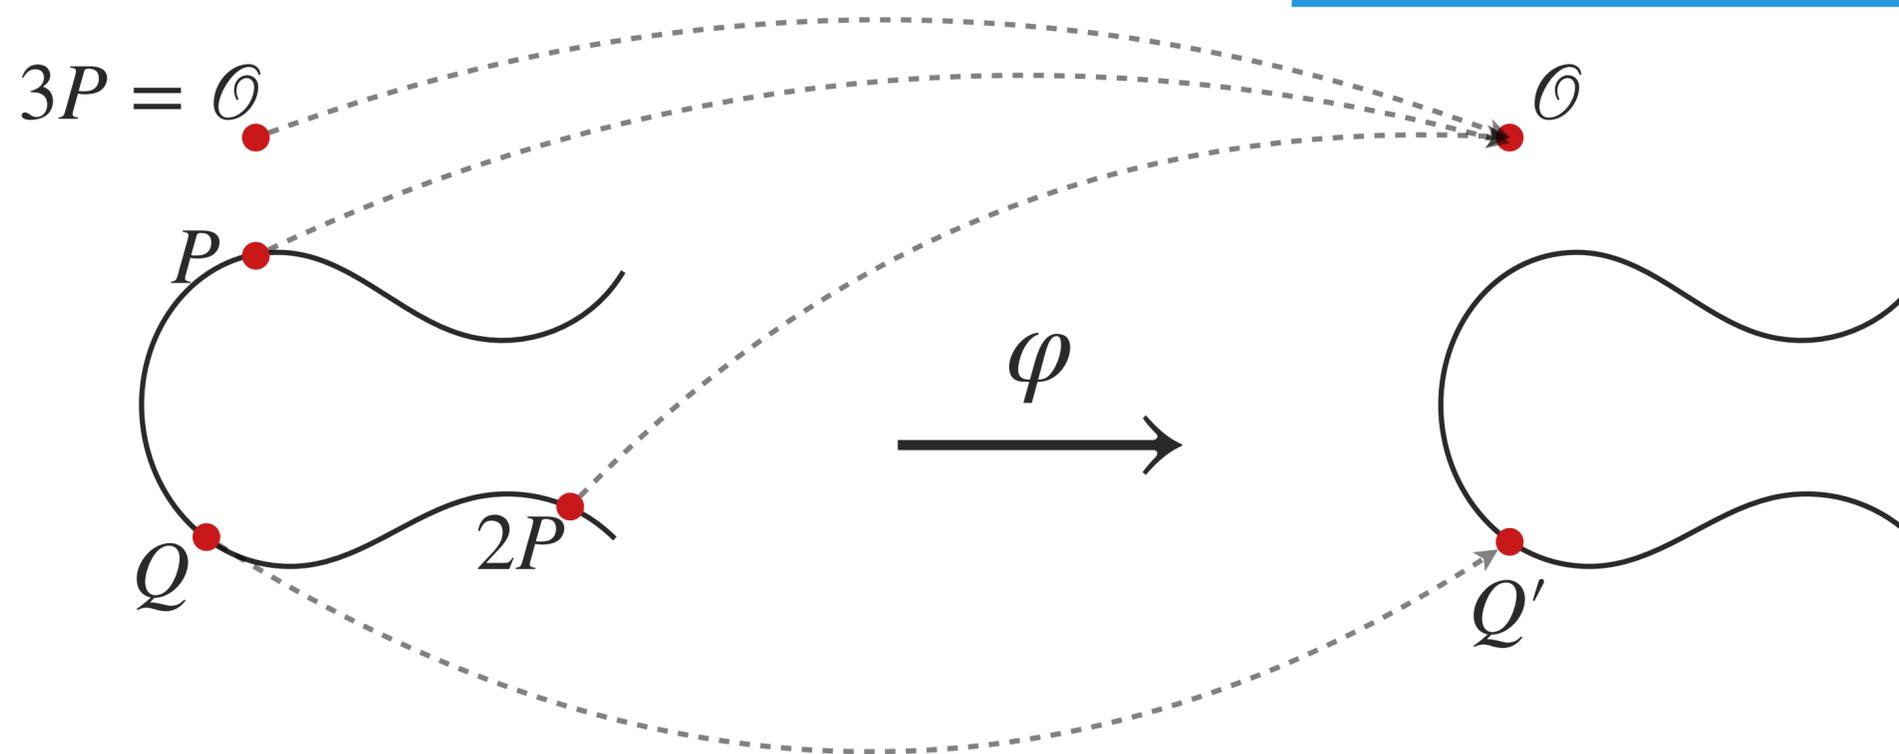

Isogeny-based cryptography

→ Isogenies: maps between elliptic curves

The isogeny path problem

Input: Two supersingular curves E and E' .

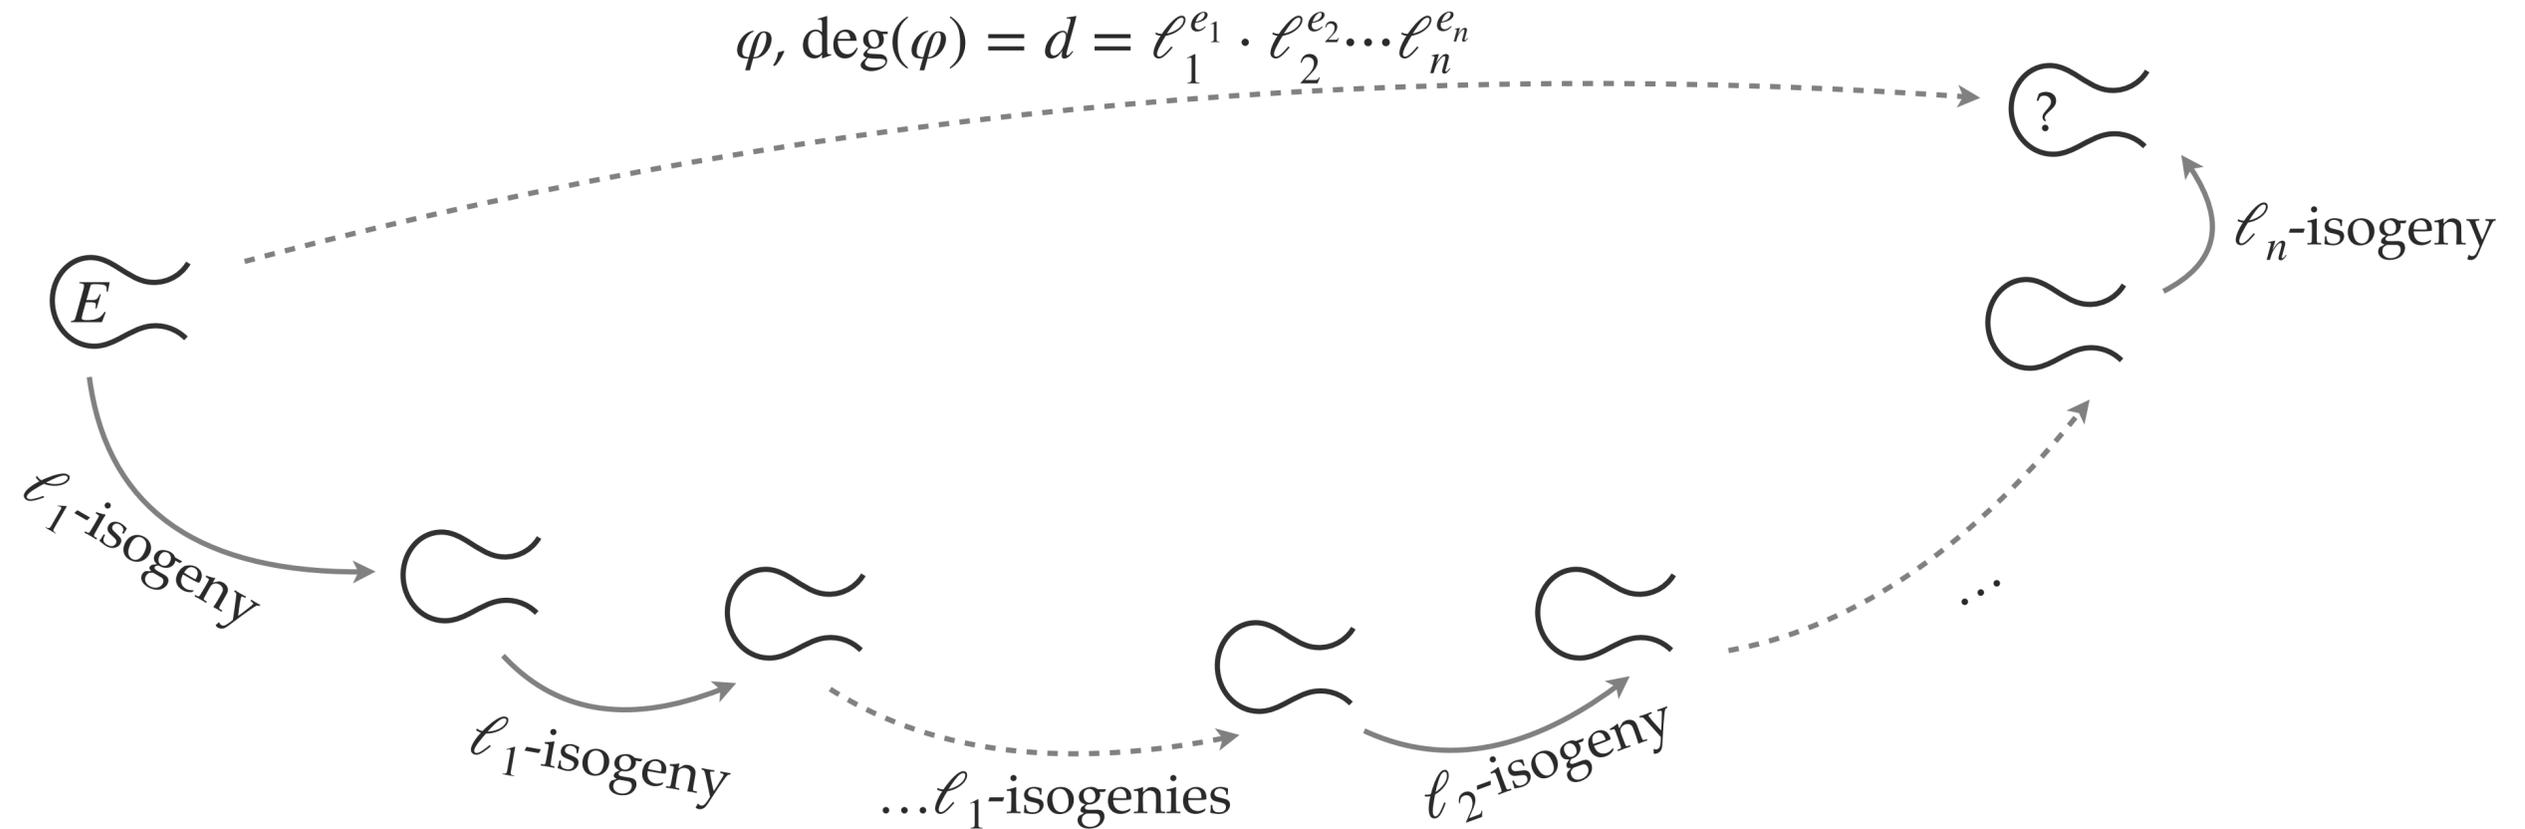

Question: Find an isogeny φ from E to E' .

$$(x, y) \mapsto \left(\frac{x^3 - 4x^2 + 30x - 12}{(x - 2)^2}, \frac{x^3 - 6x^2 - 14x + 35}{(x - 2)^3} \cdot y \right)$$

Isogeny-based cryptography

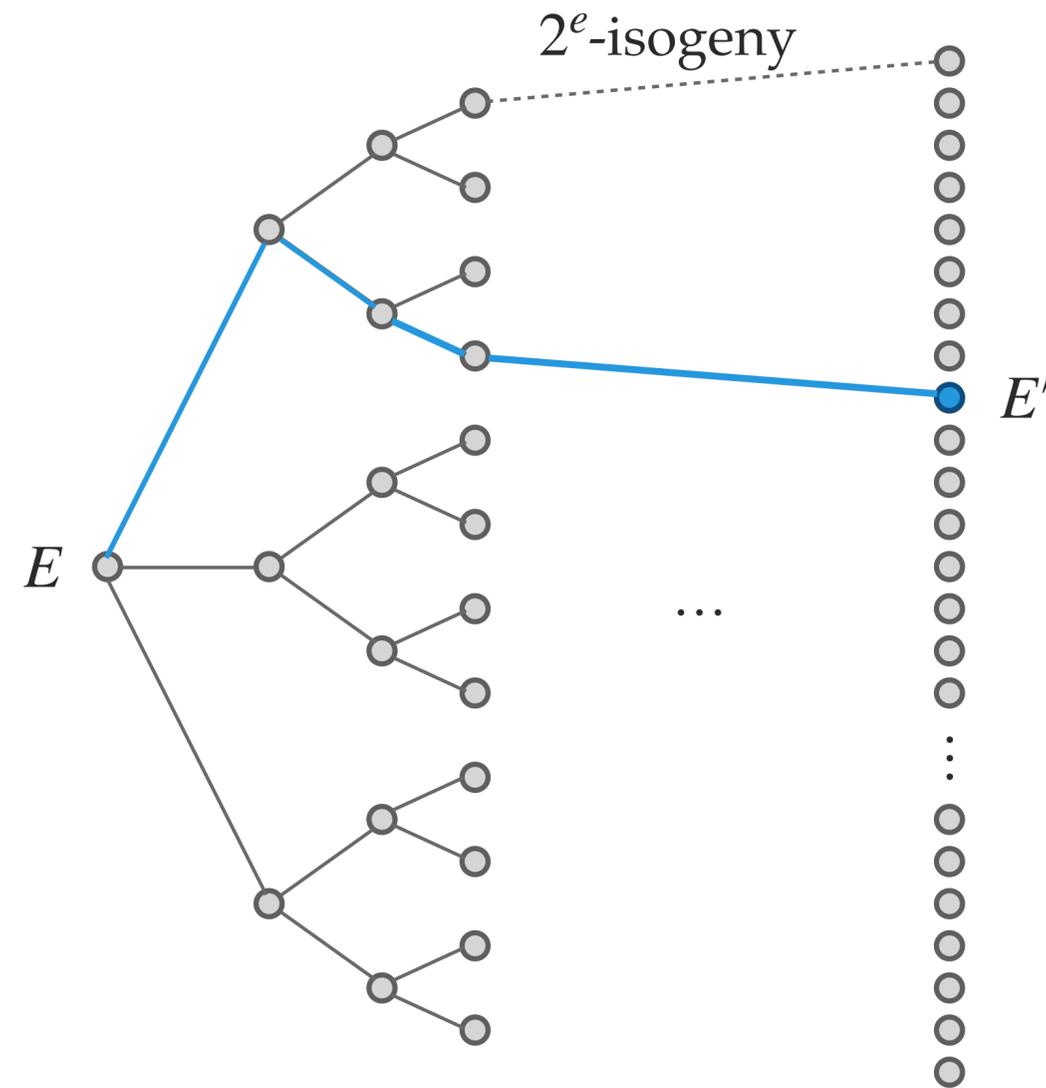

- **Degree** of an isogeny: how 'big' the isogeny is
 - ▶ Complexity of computing an isogeny: **linear in the degree**.
 - ▶ Composing isogenies: the degrees **multiply**: $\deg(\varphi \circ \psi) = \deg(\varphi) \cdot \deg(\psi)$.

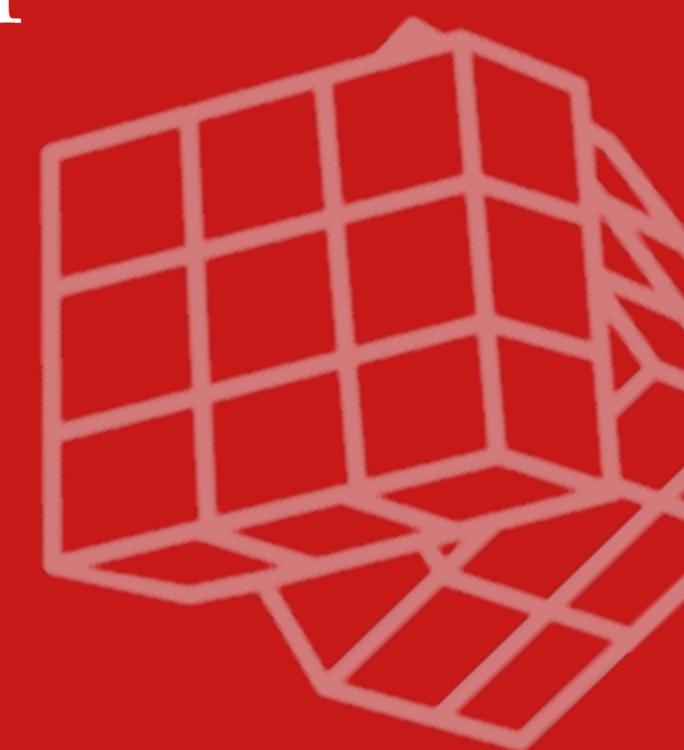

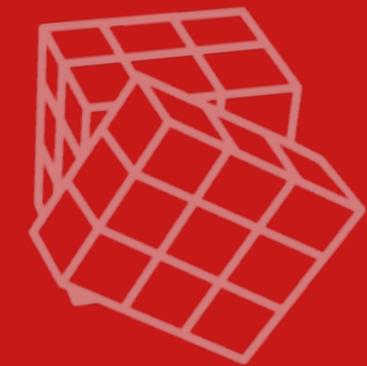

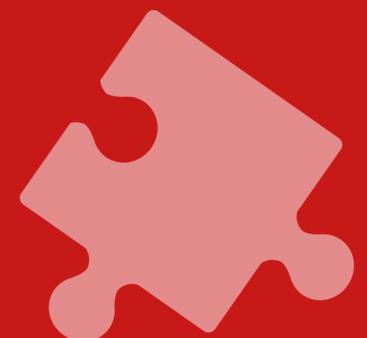

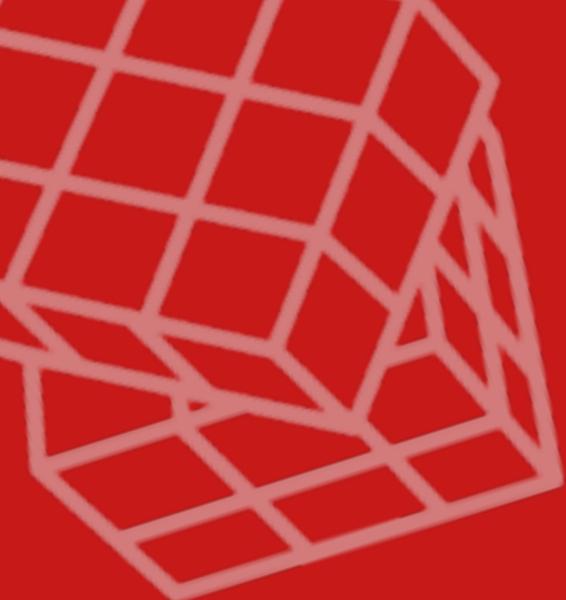

- From a curve E , there are $(\ell + 1)$ isogenies of degree ℓ .

Isogeny-based cryptography

➔ Brute-forcing the (fixed-degree) isogeny path problem.

Breaking Rainbow Takes a Weekend on a Laptop

Ward Beullens 

IBM Research, Zurich, Switzerland
wbe@zurich.ibm.com

Abstract. This work introduces new key recovery attacks against the Rainbow signature scheme, which is one of the three finalist signature schemes still in the NIST Post-Quantum Cryptography standardization project. The new attacks outperform previously known attacks for all the parameter sets submitted to NIST and make a key-recovery practical for the SL 1 parameters. Concretely, given a Rainbow public key for the

An efficient key recovery attack on SIDH

Wouter Castryck^{1,2}  and Thomas Decru¹ 

¹ imec-COSIC, KU Leuven, Belgium

² Vakgroep Wiskunde: Algebra en Meetkunde, Universiteit Gent, Belgium

Abstract. We present an efficient key recovery attack on the Supersingular Isogeny Diffie-Hellman protocol (SIDH). The attack is based on Kani's "reducibility criterion" for isogenies from products of elliptic curves and strongly relies on the torsion point images that Alice and Bob exchange during the protocol. If we assume knowledge of the endomorphism ring of the starting curve then the classical running time is polynomial in the input size (heuristically), apart from the factorization of a small number of integers that only depend on the system parameters.
